# REPORT

OF

## VISCOUNT CANNING,

*President of the Council of Chairmen of Juries*

### ON PRESENTING THE AWARDS OF THE JURIES TO THE ROYAL COMMISSION.

HAVING had the honour of acting as President of the Council of Chairmen of the Juries, it falls to me to lay before your Royal Highness and Her Majesty's Commissioners the Reports of several Juries upon the subjects submitted to them for examination, and the names of the exhibitors whom they have judged entitled to rewards.

In doing so, it will be convenient that I should state briefly the Principle upon which, by the authority of Her Majesty's Commissioners, the Juries were constituted.

The various Subjects included in the Exhibition were divided, in the first instance, into Thirty Classes. Of these, two were subsequently found to embrace fields of action too large for single Juries, and were therefore divided into Sub-Juries. This increased the number of Acting Juries to Thirty-four.

Each of these Thirty-four Juries consisted of an equal number of British subjects and of Foreigners. The British Jurors were selected by Her Majesty's Commissioners from lists furnished by the Local Committees of various towns, each town being invited to recommend persons of skill and information in the manufactures or products for which it is remarkable. The Foreign Jurors were appointed by authorities in their own countries, in such relative proportion amongst themselves as was agreed upon by the Foreign Commissioners sent here to represent their respective Governments.

In the event of a Jury finding themselves deficient in technical knowledge of any article submitted to them, they were empowered to call in the aid of Associates. These Associates, who acted as advisers only, without a vote, but whose services were of the greatest value, were selected either from the Jurymen of other classes, or from the lists of persons who had been recommended as Jurors but who had not been permanently appointed to any Jury.

Each Jury was superintended by a Chairman, chosen from its number by Her Majesty's Commissioners. The Deputy-Chairman and the Reporter were elected by the Jurors themselves.

Such was the constitution of the Thirty-four Juries taken singly. They did not, however, act independently of each other, inasmuch as they were associated into six Groups, each Group consisting of such Juries as had to deal with subjects in some degree of kindred nature; and before any decision of a Jury could be considered as final, it was required that it should be brought before an assembled Group of which that Jury formed a part, and that it should be approved by them.

The chief object of this provision was, that none of the many Foreign Nations taking part in the Exhibition

should incur the risk of seeing its interests overlooked or neglected from the accident (an unavoidable one in many instances) of its being unrepresented in any particular Jury.

Each Group of Juries received the assistance of a Deputy Commissioner and of a Special Commissioner, appointed by Her Majesty's Commissioners to record its proceedings, to furnish information respecting the arrangements of the Exhibition, and otherwise to facilitate the labours of the Juries composing the Group.

It was further determined by Her Majesty's Commissioners that the Chairmen of the Juries, consisting of British subjects and of Foreigners in equal numbers, should be formed into a Council; and that the duties of the Council should be, to determine the conditions upon which, in accordance with certain general principles previously laid down by Her Majesty's Commissioners, the different Prizes should be awarded; to frame rules to guide the working of the Juries; and to secure, as far as possible, uniformity in the results of their proceedings.

These are the most important features of the system upon which the Juries found themselves organized. I will now refer briefly to their course of action.

The Council of Chairmen, in proceeding to the discharge of their duties, were met at the outset by a serious difficulty. Her Majesty's Commissioners had expressed themselves desirous that merit should be rewarded wherever it presented itself, but anxious at the same time to avoid the recognition of competition between individual Exhibitors. They had also decided that the Prizes should consist of three Medals in different sizes; and that these should be awarded, not as first, second, and third in degree for the same class of subjects and merit, but as marking merit of different kinds and character.

The Council of Chairmen found, to their regret, that it would be impossible to lay down any rules for the awarding of the three Medals by which the appearance, at least, of denoting different degrees of success amongst the exhibitors in the same branch of production could be avoided. Accordingly, after fully explaining their difficulty to Her Majesty's Commissioners, they requested, as a course by which it might be materially diminished, that one of the Medals might be withdrawn.

Of the remaining two, they suggested that the Prize Medal should be conferred wherever a certain standard of excellence in production or workmanship had been attained—without, however, cheapness, adaptation to particular markets, and other elements of merit being taken into consideration according to the nature of the object; and they recommended that this Medal be

awarded by the Juries, subject to confirmation by the Groups.

In regard to the other and larger Medal, they suggested that the conditions of its award should be some important novelty of invention or application, either in material, or processes of manufacture, or originality combined with great beauty of design; but that it should not be conferred for excellence of production or workmanship alone, however eminent; and they further suggested that this Medal should be awarded by the Council of Chairmen upon the recommendation of a Jury, supported by its Group.

The principle thus described met the views of Her Majesty's Commissioners, and was subsequently further developed by the Minute which they communicated to the Council of Chairmen. (See APPENDIX C.) Its application, however, was not without difficulties, especially as regarded the Foreign Jurors. Many of these had taken part in the National Exhibitions of France and Germany; and to them the distinctive character of the two Medals, and the avoidance of all recognition of degrees of merit between the recipients of prizes, were novel principles, and at variance with their experience; inasmuch as one of the chief purposes of the National Exhibitions of the Continent, has been to distinguish the various degrees of success attained by rival exhibitors.

It was to be expected, therefore, that cases would arise in which the Council Medal, as the higher reward, would be asked for Exhibitors whose claims were only somewhat stronger in degree, without differing in kind from those of others to whom the Prize Medal had been awarded. In such cases it became the duty of the Council of Chairmen to refuse their sanction to the award of the Council Medal; without, however, necessarily impugning the alleged superiority of the article for which it was demanded. On the other hand, some instances have occurred in which they have felt themselves obliged, upon to confirm the claim to a Council Medal, to award the object for which it was claimed showed, in itself, less merit of execution or manufacture than others of its Class. It follows, therefore, that the award of a Council Medal does not necessarily stamp its recipient as a better manufacturer or producer than others who have received the Prize Medal. It is rather a mark of such invention, ingenuity, or originality as may be expected to exercise an influence upon industry more extended, and more important, than could be produced by mere excellence of manufacture.

This is to be borne in mind in considering the List of Awards which I have the honour to lay before your Royal Highness; and I trust it will be found that the Juries have succeeded in doing justice to the Exhibitors of every Nation and Class, and that they have not departed in any important degree from the purpose of Her Majesty's Commissioners.

One of the first instructions addressed to the Juries by the Council of Chairmen was to the effect that the Prizes should be awarded without reference to the Country of the Exhibitors, the Exhibition being considered in this respect as recognizing no distinction of Nationality. It is gratifying to find that the Jurors of every country

ordinarily acquiesced in this principle, and that, notwithstanding unavoidable differences of opinion, uninterrupted harmony prevailed amongst them throughout the whole course of their labours. It is not too much to hope that the happy influence of this intercourse may extend and endure far beyond the present occasion.

It is not necessary that I should detain your Royal Highness and Her Majesty's Commissioners with a recital of the other instructions issued by the Council of Chairmen for the guidance of the Juries, or with a detailed account of their proceedings in the discharge of their own functions.

The number of Prize Medals awarded is 2,918. The number of Council Medals is 170.

It is important to observe that no more than one Medal of either denomination has been allotted to one Exhibitor in the same Class, although he may have contributed to that Class more than one article deserving of reward.

The Juries have found it just, in framing their Reports, to make Honourable Mention of certain Exhibitors whose contributions were not such as to entitle them to receive a Medal. Some have applied specimens of raw materials, which, although curious and instructive, do not imply any great merit of production on the part of the Exhibitor; and others have furnished articles of manufacture which, without reaching a high degree of excellence, are interesting as examples of the processes, or present condition of the trades which they illustrate.

Before concluding, I trust I may be allowed to remark that it would be difficult duly to estimate the time and labour expended by the Jurors in their endeavour to discharge faithfully the important duty confided to them. The number of Exhibitors was about 17,000. Of these many, who were reckoned but once in the Catalogue, contributed a large variety of objects, and came within the province of more than one Jury; whilst in other cases towns, and even whole countries, were counted as single Exhibitors, although they presented for examination every kind of manufacture and raw produce which their ingenuity and natural resources could furnish. Upon the whole, the task of the Juries involved the consideration and judgment of at least a million of articles; the difficulties attending it being not a little increased by the want of a uniform system of classification of the subjects in some of the foreign divisions, and by unavoidable imperfections in the Catalogue.

In these circumstances the Juries can scarcely venture to hope that accidental omissions may not have occurred; but they have the satisfaction of feeling that these, if any, are not attributable to a want of care or diligence on their part.

It now only remains for me, in laying the result of our labours respectfully before your Royal Highness and Her Majesty's Commissioners, to offer, on behalf of my Colleagues and myself, our grateful acknowledgment of the honourable confidence which you have placed in us; and to express the hope that we shall be found to have fulfilled our trust in a manner worthy of the noble undertaking in which we are proud to have been called upon to bear a part.

CANNING.

## APPENDIX A.

## DECISIONS REGARDING JURIES.

## GENERAL CONDITIONS.

1. There shall be one Jury to each of the Thirty Classes, into which the Exhibition is divided.
2. The number of Jurors in each Jury is determined by the amount of articles exhibited in each Class, and the greater or less diversity of the subjects included in it, but no abstract idea of the relative importance of the Classes is involved in the numbers attached to them.
3. The following list describes the Thirty Juries, and the number of Jurors to each Jury:—

## A. RAW MATERIALS.

Number  
of Jurors.

- I. Mining, Quarrying, Metallurgical Operations, and Mineral Products . . . . . 8
- II. Chemical and Pharmaceutical Processes and Products generally . . . . . 8
- III. Substances used as Food . . . . . 6
- IV. Vegetable and Animal Substances chiefly used in Manufactures, as Implements, or for Ornament . . . . . 8

## B. MACHINERY.

- V. Machines for direct use, including Carriages and Railway and Naval Mechanism . . . . . 12
- VI. Carriages . . . . . 6
- VII. Manufacturing Machines and Tools . . . . . 12
- VIII. Civil Engineering, Architectural and Building Contrivances . . . . . 8
- IX. Naval Architecture and Military Engineering; Ordnance, Armour, and Accoutrements . . . . . 8
- X. Agricultural and Horticultural Machines and Implements . . . . . 12
- XI. Philosophical Instruments and processes depending upon their use: Musical, Horological, and Surgical Instruments . . . . . 12
- XII. Musical Instruments . . . . . 10
- XIII. Horological . . . . . 8
- XIV. Surgical . . . . . 6

## C. MANUFACTURES.—Textile Fabrics.

- XV. Cotton . . . . . 10
- XVI. Woollen and Worsted . . . . . 12
- XVII. Silk and Velvet . . . . . 10
- XVIII. Manufactures from Flax and Hemp . . . . . 10
- XIX. Mixed Fabrics, including Shawls, but exclusive of Worsted Goods (Class XII.) . . . . . 12
- XX. Leather, including Saddlery and Harness, Skins, Fur, Feathers, and Hair . . . . . 10
- XXI. Paper and Stationery, Printing, and Book-binding . . . . . 8
- XXII. Woven, Spun, Felted, and Laid Fabrics, when shown as specimens of Printing or Dyeing . . . . . 10
- XXIII. Tapestry, including Carpets and Floor-cloths, Lace and Embroidery, Fancy and Industrial Works . . . . . 10
- XXIV. Articles of Clothing for immediate Personal or Domestic Use . . . . . 8

## D. Metallic, Vitreous, and Ceramic Manufactures.

- XXV. Cutlery and Edge Tools . . . . . 6
- XXVI. Iron and General Hardware . . . . . 12
- XXVII. Working in Precious Metals, and in their Imitations, Jewellery, and all articles of Virtue and Luxury, not included in the other Classes . . . . . 10
- XXVIII. Glass . . . . . 10
- XXIX. Ceramic Manufacture, (China, Porcelain, Earthenware, &c.) . . . . . 10

\* The Jury for Agricultural Implements is made exceptional, as the Agricultural Committee, consisting of eminent Members of the Royal Agricultural Society, have undertaken the functions of the Jury. Foreigners may be added to this Committee if desired.

## E. Miscellaneous Manufactures.

Number  
of Jurors

- XXX. Decorative Furniture and Upholstery, including Paper Hanging, Paper Mache, and japanned Goods . . . . . 12
- XXXI. Manufactures in Mineral Substances, useful for building or decoration, as Marble, Slate, Porphyries, Cements, Artificial Stones, &c. . . . . 8
- XXXII. Manufactures from Animal and Vegetable Substances, not being Woven or Felted, or included in other Sections . . . . . 8
- XXXIII. Miscellaneous Manufactures and Small Works . . . . . 8

## F. FINE ARTS.

- XXXIV. Sculpture, Models, and Plastic Art . . . . . 15

318

4. A classified List of Subjects under the province of each Jury is prepared, and forms the Constitution to each Class.

5. The Articles in the Building are arranged as far as possible in the 30 Classes, so as to be coincident with the field of action of each Jury, and facilitate its labours.

6. If Exhibitors accept the office of Jurors, they cease to be competitors for prizes in the Class to which they are appointed, and these cannot be awarded either to them individually, or to the firms in which they may be partners.

7. Juries may take evidence when a majority of the Jury deem it advisable, and name the persons to be consulted. Jurors of another Class may also be called in aid by a Jury, when information involved in that Class is required.

8. Juries may act in matters of detail by sub-committees, but no award can be made except by the majority of the Jury.

9. Before a Jury can finally make its awards, they must be submitted to a meeting of the Council of allied subjects, as indicated in the groups in the Division 2. These Meetings of allied Juries will have power to confirm the award of the Juries, and to investigate any disputed decisions. Before, however, the awards are published, they must be submitted to a Council, consisting of the Chairmen of the Juries, in order to secure uniformity of action—and a compliance with the regulations originally laid down by that body.

10. The awards of a Jury, when reported by the Council of Chairmen as being made in conformity to the rules, are final.

11. The Juries will commence their duties on Monday the 12th May, at 12 o'clock, and will be aided in the general transaction of the business by a person to be named by the Royal Commissioners, who by himself, or by a deputy to be approved of by the Commission, may be present at their deliberations, for the purpose of explaining the rules of the Commission. This Member of the Commission will not have a vote in any of the Juries, or at all interfere in the adjudication of awards.

## CONSTITUTION OF JURIES.

12. The Jury will in general consist of an equal number of British subjects and of Foreigners.\*

13. If Foreign Commissioners do not send a sufficient number of Foreigners to represent one-half of the Jurors in each Class the deficient numbers may be completed by the appointment of British subjects.

14. Country as well as Metropolitan districts will be represented on the Jury.

\* The following list contains the actual number of the Jurors sent by each country:—

Austria . . . . .	17	Russia . . . . .	7
Belgium . . . . .	14	Sicily . . . . .	1
Denmark . . . . .	1	Spain . . . . .	4
Egypt . . . . .	2	Switzerland . . . . .	7
France . . . . .	34	Sweden . . . . .	1
Great Britain . . . . .	160	Turkey . . . . .	5
Greece . . . . .	1	United States . . . . .	24
North Germany . . . . .	2	Zollverein . . . . .	23
Holland . . . . .	2		
Italy . . . . .	1		
Portugal . . . . .	2		
		Total . . . . .	318

15. Each Jury will be provided over by a Chairman to be nominated by the Commissioners, and he will be aided by a Deputy-Chairman to be elected by the Jury.

16. Juries may appoint one of their own body as a Reporter.

#### COUNCIL OF CHAIRMEN.

17. The Chairmen of the Juries will be associated as a Body, to be called the "Council of Chairmen."

18. In the absence of a Chairman, the Deputy-Chairman will take his seat at the Council.

19. The Council of Chairmen will be constituted, as far as practicable, of British subjects and Foreigners in equal numbers.

20. The first and chief duties of the Council of Chairmen will be to frame the rules for the guidance of the Juries.

21. The Council will have to determine the conditions under which the 1st, 2d, and 3rd Class Medals respectively are to be awarded, and to define the general principles to which it will be advisable to conform in the awards in the several departments of the Exhibition. It is the wish of the Commission that Medals should be awarded to articles possessing decided superiority, of whatever nature that superiority may be, and not with reference to a merely individual competition. The three Classes of Medals are intended to distinguish the respective characters of subjects, and not as first, second, and third in degree for the same class of subjects.

\* The following Decisions relative to Prizes and Juries, already published, are repeated for the purpose of more detailed information:

"Her Majesty's Commissioners have had under their consideration the subject of the Prizes to be awarded to exhibitors, and have resolved to take immediate steps for having (three) Medals struck of various sizes and different designs, it being their opinion that this is the form in which it will, generally speaking, be most desirable that the rewards should be distributed. They have decided to select bronze for the material in which the Medals are to be executed, considering this metal to be better calculated than any other for the development of superior skill and ingenuity in the modelling of art, and at the same time the most likely to constitute a lasting memorial of the Exhibition."

"With regard to the mode in which the Prizes are to be awarded, the Commissioners think it inexpedient to establish beforehand rules of process as to fetter the discretion of the Juries upon which the task will ultimately devolve. It will be sufficient for the present to indicate the general principle to which it will probably be advisable to conform in the award of Prizes for successful competition in the several departments of the Exhibition."

"In the department of RAW MATERIALS AND PRODUCE, for instance, Prizes will be awarded upon a consideration of the value and importance of the article, and the superior excellence of the particular specimens exhibited; and in the case of prepared materials, coming under this head of the Exhibition, the Juries will take into account the novelty and importance of the prepared product, and the superior skill and ingenuity manifested in the process of preparation."

"In the department of MACHINERY, the Prizes will be given with reference to novelty in the invention, superiority in the execution, increased efficiency, or increased economy, in the use of the article exhibited. The importance, in a social or other point of view, of the purposes to which the article is to be applied, will also be taken into consideration, as will also the amount of the difficulties overcome in bringing the invention to perfection."

"In the departments of MANUFACTURES, those articles will be rewarded which fulfil in the highest degree the conditions specified in the sectional list viz.—lucidity, usefulness, such as permanency in dyes, improved forms, and arrangements, in articles of utility, &c. Superior quality, or superior skill in workmanship. New use of known materials. Use of new materials. New combinations of materials, as in metals and pottery. Beauty of design in form, or colour, or both, with reference to utility. Cheapness, relatively to excellence of production."

"In the department of SCULPTURE, PAINTING, AND PLASTIC ART, the awards will have reference to the beauty and originality of the specimens exhibited, to improvements in the processes of production, to the application of art to manufactures, and in the case of models, to the interest and utility of the subject represented."

"The general principles are sufficient to show that it is the wish of the Commission, as far as possible, to reward articles in any department of the Exhibition which may

22. The Council of Chairmen must see that the awards of the individual Juries are in accordance with the rules before they are considered final.

23. Although the Commissioners may be disposed, under peculiar circumstances, as set forth in the ante-mentioned decision, to consider the propriety of pecuniary grants to individual exhibitors, they will only take such applications into consideration on the recommendation of the several Juries, sanctioned by the Council of Chairmen.

24. As some of the more important duties of the Council of Chairmen are preliminary to the action of the Juries, it is necessary that they should meet one week previous to the assembling of the Juries. The duties of the Council will therefore commence on Monday, the 5th of May.

25. In order to represent the wishes of the Commission, and to explain its rules, a nominee of the Commission will attend the meetings of the Council, and aid it in the transaction of business; but he will not possess a vote, or act as a member of the Council.

#### MODE OF APPOINTING THE ENGLISH JURORS.

26. Those persons which exhibit to a considerable extent in any of the Classes will be invited to send a list of names of persons who would efficiently represent the knowledge of those Classes as Jurors.

27. It will be necessary to state, according to the classified Jury list, the subdivisions of the class with which the person recommended is specially acquainted; and all nominations must be made in classes, and not in the aggregate.

28. As it is necessary to reduce the lists to the standard number for each Jury, the Commission charges itself with this duty.

29. Those persons who have been recommended as Jurors, but who from the small numbers of the Jury are not placed on it, may, on the application of a Jury, be called in on special occasions, to give aid, under the title of Associates, but with a vote.

appeal to competent judges to assess any decided superiority, of whatever nature that superiority may be. It is the intention of the Commissioners to reward excellence in whatever form it is presented, and not to give inducements to the distinctions of a merely individual competition. Although the Commissioners have determined on having three Medals of different sizes and designs, they do not propose to instruct the Juries to award them as first, second, and third, in degree for the same class of subjects. They do not wish to channel the Juries by any precise limitation; but they consider that the Juries will rather view the three kinds of Medals as a means of appreciating and distinguishing the respective characters of the subjects to be rewarded, and not of making distinctive marks in the same class of articles exhibited. They fully recognise that excellence in production is not only to be looked for in high-priced goods, in which much cost of labour and skill has been employed, but they encourage the exhibition of low-priced fabrics, when combining quality with lowness of price, or with novelty of production. They can readily conceive that Juries will be justified in giving the same class Medal to the cheapest Calico Print, made for the Brazilian or other South American market, as they would to the finest piece of *Mousseline de Soie* or *Mousseline de Laine*, if each possessed excellence of its own kind.

\* Lastly, the Commissioners in announcing their intention of giving Medal Prizes, do not propose altogether to exclude pecuniary grants, either as Prizes for successful competition, or as awards under special circumstances, accompanying, and in addition to, the honorary distinction of the Medal. There may be cases in which, on account of the condition of life of the successful competitor (as, for instance, in the case of workmen), the grant of a sum of money may be the most appropriate reward of superior excellence; and there may be other cases of a special and exceptional nature, in which, from a consideration of the expense incurred in the preparation or transmission of a particular article entitled to a Prize, combined with a due regard to the condition of pecuniary circumstances of the party exhibiting, a pecuniary grant may with propriety be added to the honorary distinction. The Commissioners are not prepared, for the present, at least, to establish any regulations on these heads. They consider it probable that a wide discretion must be left to the Juries to determine, hereafter appointed, with respect to the award of Money Prizes, or the grant of money in aid of honorary distinctions; it being understood that such discretion is to be exercised under the superintendence and control of the Commission.

## MODES OF APPOINTING FOREIGN JURORS

**Not.**—The decisions regarding Foreign Jurors are delayed until the opinions of the Agents of Foreign Commissions are obtained as to the proportions in which each nation should be represented in the respective classes, and as to the principles of nomination most agreeable to the countries which they represent.

## MEETING OF JURORS

31 The Jurors, on being appointed, will receive immediate notice of appointment, and their names will be published.

32. The Chairman will be required to meet on Monday the 5th May, at 10 o'clock.

33 The Jurors will meet for the transaction of business, on Monday the 12th May, at 10 o'clock.

34 Although impossible to set apart special days in which the Jurors alone can examine the articles exhibited, to the exclusion of the public, arrangements will be made to carry on these examinations with as little delay as possible.

35 Jurors, immediately on their arrival in London, are requested to report themselves at the Jury Office in the Exhibition Building where they will obtain their Jurors' ticket, and receive all necessary information.

## APPENDIX A 1.

## CLASSIFICATION OF SUBJECTS IN THE THIRTY CLASSES INTO WHICH THE EXHIBITION IS DIVIDED

## RAW MATERIALS.

- I Mining, Quarrying, Metallurgical Operations and Mineral Products.
- II Chemical and Pharmaceutical Processes and Products generally.
- III Substances used for Food.
- IV Vegetable and Animal Substances, chiefly used in Manufactures, as Implements or for Ornament.

## MACHINERY

- V Machines for direct use, including Carriages and Railway and Naval Mechanisms.
- VI Manufactures in Machines and Tools.
- VII Civil Engineering, Architectural and Building Contrivances.
- VIII Naval Architectural and Military Engineering, Ordnance Armour and Accoutrements.
- IX Agricultural and Horticultural Machines and Implements.
- X Philosophical Instruments and Processes depending upon the use, Musical, Horological and Surgical Instruments.

## MANUFACTURES.

- XI Cotton.
- XII Woollen and Worsted.
- XIII Silk and Velvet.
- XIV Manufactures from Flax and Hemp.
- XV Mixed Fabrics, including Shawls, but exclusive of Worsted Goods (Class XII).

XVI Leather, including Saddlery and Harness, Skins, Fur, Feathers, and Hair.

XVII Paper and Stationery, Printing and Bookbinding.

XVIII Woven, Spun, Felted, and laid Fabrics, when shown as specimens of Printing or Dyeing.

XIX Tapestry, including Carpet and Floor-cloths, Lace and Embroidered Laces and Industrial Works.

XX Articles of Clothing for immediate Personal or Domestic Use.

XXI Cutlery and Edge Tools.

XXII Iron and General Hardware.

XXIII Working in precious metals and in their imitations, Jewellery, and all articles of Virtu and Luxe, not included in all other Classes.

XXIV Glass.

XXV Ceramic Manufactures, China, Potcelain, Earthenware, &c.

XXVI Decorative Furniture, Upholstery, including Paper-hanging, Paper Mache and Japanese Goods.

XXVII Manufactures in Mineral substances, used for building or decoration, as Marble, Slate, Porphyries, Cements, Artificial Stones, &c.

XXVIII Manufactures from Animal and Vegetable Substances, not being Woven or Felted, or included in other Sections.

XXIX Miscellaneous Manufactures and Small Wares.

## FINE ARTS

XXX Sculpture Models and Plastic Art.

## 1. Mining, Quarrying, Metallurgical Operations, and Mineral Products.

## A. MINING AND QUARRYING OPERATIONS

- 1 Quarries and open workings.
- 2 Streaming, washing alluvial deposits.
- 3 Mines worked in the lode.
  - a Sinking of shafts.
  - b Cutting adits.
  - c Drying levels.
- 4 Mines worked on the bed.
  - a Sinking shafts.
  - b Drying levels.
  - c Cutting stalls or headings.
- 5 Salt deposits.
- 6 Ventilation; Safety Lamps, and other modes of Lighting.
- 7 Methods of raising Men, Ore, and Water.
  - a Raising Ore.
  - b Lowering and raising Miners.
  - c Dredging.

## B. GEOLOGICAL MAPS, PLANS, AND SECTIONS

## C. ORES AND MINERALOGICAL OPERATIONS

- 1 Ores, and the Methods of dressing and rendering Ores merchantable.

a Ores of the more common Metals, as of Iron, Copper, Zinc, Tin, Lead.

b Native Metals, as Gold, Silver, Copper, &c.

c Ores used for various purposes without reduction, as Peroxide of Manganese, &c.

Methods of roasting, smelting, otherwise reducing.

d The common Metals, as Iron, Copper, Zinc, Tin, Lead.

e The Metals as generally used in combination, as Antimony, Bismuth, Cadmium, Cobalt, Nickel, &c.

f Methods of preparing the noblest Metal, as Gold, Silver, Mercury, Palladium, Platinum, &c.

g Adaptation of Metals to special purposes.

a Metals in various chemical states, as Iron in the condition of Cast and Malleable Iron, Steel, &c.

b Metals in their progress to finished Manufactures, as Wires and Ingots, Sheets, Bars, Wires, &c.

c Alloys and methods of making more generally useful metals and their alloys, as Gunmetal, Brass, &c.

d Brass, and alloys used as a substitute for Iron.

## APPENDIX A1.

- a. Pigments employed in House Decoration, and for colouring Woods.
- b. Pigments used for Textile Fabrics.
- c. Pigments used for Paper Manufacture, and for felted and laid Fabrics generally.
- d. Artists' Colours.
- e. Miscellaneous Chemical Manufactures.

**B. RARE CHEMICAL SUBSTANCES MANUFACTURED SPECIALLY FOR THE USE OF THE SCIENTIFIC CHEMIST.**

1. From Substances of the Mineral Kingdom.
2. " " " Vegetable
3. " " " Animal

### C. CHEMICAL SUBSTANCES USED IN MEDICINE AND IN PHARMACY.

1. From the Mineral Kingdom.
  - a. Non-metallic substances and their compounds.
  - b. Alkalies, Earths, and their compounds.
  - c. Metallic Preparations.
2. From the Vegetable Kingdom, when shown for Pharmaceutical Purposes. (See also Sections III. and IV.)
  - a. Vegetable Infusions, Decoctions and Solutions, clear or saccharine.
  - b. Tinctures.
  - c. Extracts and inspissated Juices.
  - d. Resins, Gum Resins, and Oleo Resins, and Balsams.
  - e. Albes, &c.
  - f. Gums as Acacia, Tragacanth, &c.
  - g. Essential Oils, Capseput, Savina, Turpentine, &c.
  - h. Fixed Oils, as Castor, Croton, Almond, Olive, &c.
  - i. Vegetable parts, as leaves of Digitalis, Hemlock, roots of Japan, Ipecacuanha, &c.
  - j. Barks as Imported, Cinchona, Cascarilla, Cusparia, &c.
  - k. Vegeto-Alkalies, their Salts, and other Crystalline principles of medicinal substances.
  - l. Vegetable Acids.
  - m. Miscellaneous Compounds.
3. From the Animal Kingdom.
  - a. Cod-liver and other Animal Oils for infernal or external application.
  - b. Unguents of Spermaceti, Lard, Oil, and combinations of these.
  - c. Antispasmodics, as Musk, Castoreum, Civet, Ambergris, &c.
  - d. Phosphorus, Ammonia, and their products.
  - e. Irritants, as Cantharides.
  - f. Antichylous Crab-eyes, Calcareous concretions of the Claw-fish, Tuttle-bone, &c.

## VEGETABLE KINGDOM.

**A. AGRICULTURAL PRODUCE -- CEREALS, PULSES, OILS,  
SEEDS, ETC.**

1. Common European Cereals.
2. Cereals more rarely cultivated in Europe.
3. Millet and other small grains used as food.
4. Pulse and Cattle Food.
5. Grasses, Fodder Plants, and Agricultural Roots.
6. The Flours or preparations of the above classes.
7. Oil Seeds and their Oils.
8. Hops and other aromatic plants used for like purposes.

### B. DRIED FRUITS AND SEEDS.

1. Raisins, Currants, Figs, Plums, Cherries, Apricots,
2. Dates, Tamarinds, Dried Bananas, &c.
3. Almonds, Chestnuts, Walnuts, &c.
4. Cocoa-nuts, &c.

**SUBSTANCES USED IN THE PREPARATION OF DRINKS:**

1. Real Teas of all kinds.
2. Substitute for Teas, as Paraguay, Granitum, Benecotum, &c.
3. Coffee of all kinds, and Cocoa Seeds and Nibs.
4. Various substances, as Chocolate Root, Amanda de Ferre, Guarana Bread, &c.

D. INTOXICATING DRUGS, FERMENTED LIQUORS, AND DISTILLED SPIRITS FROM UNUSUAL SOURCES.

1. Fermented Liquors and Spirits from unusual sources.
2. Tobacco.

## II. Chemical and Pharmaceutical Processes and Products generally.

### CHEMICAL SUBSTANCES USED IN MANUFACTURE.

1. From the Mineral Kingdom.
  - a. Non-metallic substances.
    - Those found principally in their elementary state, as Sulphur, Phosphorus, &c.
    - Acids, as Sulphuric, Malacic, Nitric, Boracic, &c.
    - Miscellaneous Manufactures, as Sulphures of Carbon, Chloride of Sulphur, &c.
  - b. Alkalies, Earths, and their compounds.
    - Alkalies and their Alkaline Salts, Soda, Potash, Ammonia, and the Carbonates, &c.
    - Neutral Salts of the Alkalies, as Sulphate, Nitrate of Soda, Saltpetre, Borax, &c.
    - Earths and their compounds, as Lime, Magnesia, Barytes, Strontia, Alumina, &c.
  - c. The compounds of Metals proper, as Salts of Iron, Copper, Lead, &c.
  - d. Mixed Chemical Manufactures, as Prussiate of Potash, &c.
2. From the Organic Kingdom, and not included in Sections III. and IV.
3. Manufactures of Plaster, Dyes, and Miscellaneous Chemical Manufactures. (See also Section IV.)

3. Opium.
4. Hemp, and other intoxicating Drugs.

## E. SPICES AND CONDIMENTS.

1. Cinnamon, Cassia, and their substitutes.
2. Nutmegs and Mace; Cloves and Cassia Buds.
3. Peppers, Capsicum, Mustard, Vanilla, Pimento, Cardamums, &c.
4. Ginger, Turmeric, &c.

## F. STARCH SERIES.

1. Starches of all kinds prepared from Wheat, Rice, Potatoes, Maize, &c.
2. Arrowroots of all kinds, Tapioca, &c.
3. Sagos from the Palms, Cassava, Tapioca, &c.
4. Ichens of all kinds.
5. Other Starchy Substances, as Portland Sago from *Arum maculatum*, and from various like plants.

## G. SUGAR SERIES.

1. Sugars from the Cane and Beet  
Maple and Palms.  
Birch, Poplar, Oak, and Ash.  
Graph Sugar.
2. Licorice, Sarcocoll, &c.

## ANIMAL KINGDOM.

## II. ANIMAL FOOD AND PREPARATIONS OF FOOD AS INDUSTRIAL PRODUCTS.

1. Specimens of preserved Meats.
2. Portable Soups, and concentrated nutriment, as consolidated Milk, &c.
3. Caviare, Trepan, &c.
4. Articles of Eastern commerce, as Shark Fins, Nest of the Java Swallow, &c.
5. Honey and its preparations.
6. Blood and its preparations.
7. Industrial Products, as Glue, Gelatine, Isinglass, Gluten, &c.

## IV. Vegetable and Animal substances, chiefly used in Manufactures, as Implements, or for Ornaments.

## VEGETABLE.

## A. GUM AND RESIN SERIES.

1. Gums of all kinds of natural occurrence—Gums made artificially, as British Gum, Mucilaginous Seeds, Barka, Pods, and Seaweeds.
2. Resins—Resins and Balsams of all kinds.  
Gum Resins.  
Gum Elastic and Gutta Percha.  
Distilled Resins and Varnishes.

## B. OIL SERIES.

1. Volatile Oils, including Camphor.
2. Drying Fat Oils.
3. Non-drying Fat Oils.
4. Solid Oils.
5. Wax.
6. Distilled Fat Oils.

## C. ACIDS, AS ACETIC, CITRIC, TARTARIC, OXALIC, &amp;c.

## D. DYES AND COLOURS.

1. Indigos.
2. Madders.
3. Lichens and their preparations.
4. Dying Barks, as Acacia, Quercitron, Mangrove, &c.
5. Woods, as Log-wood, Brazil-wood, Persim-wood, Fustic, &c.
6. Flowers and Berries, as Persian Berries, Safflower, Saffron.
7. Miscellaneous, as Turmeric, &c.

## E. TANNING SUBSTANCES.

1. Pods, Berries, Seeds, and Fruits of various kinds, as *Albizia*, *Acacia*, Nib-nib and Divi-divi Pods, &c.
2. Barks of various kinds, as Barks of the Babool, *Banisteria*, *Aschmannia*, *Muriel*, *Racina*, *Gordonia*.
3. Galls, and similar Tanning Materials.
4. Catechu, Kino, Quercitron, &c.

## F. FIBROUS SUBSTANCES, INCLUDING MATERIALS FOR CORDAGE AND CLOTHING.

1. Cottons of all kinds.
2. Hemp and Flax; Manila Hemp and New Zealand Flax.

3. China Grass, Nettle Fibre, Plantain, and Pine Apple Fibre.

4. Sunn, Jute, and other tropical substitutes for Hemp, Flax.

5. Coir, or Cocoa-Nut Fibre, Gunny, &c.
6. Fishes and Miscellaneous Substances.

## G. CELLULAR SUBSTANCES.

1. Corks of all kind.
2. Woods and Rootlets used for Corks as the *Ochroma*, *Myrica* and *Alnus palustris*.
3. Rice-paper of China.
4. Birch Bark, Pottery Bark, Citrus Kind, &c.
5. Substances used as Amadou.

## H. TIMBER AND FANCY WOODS USED FOR CONSTRUCTION AND ORNAMENTS, AND PREPARED BY DYEING.

1. Suited chiefly for purposes of construction, for the Navy.
2. Suited chiefly for Ornaments, Work.
3. Prepared Woods, as by Kyani's, Béchamps, and Boucherie's processes.

## I. MISCELLANEOUS SUBSTANCES.

1. Substances used as Soap, as Quillai Bark, Strap Berries (*Sapindus saponaria*), Soap Roots (*Saponaria officinalis*, &c.).
2. Perfumes, as Pacha, Pat, Vetiver, Spikenard, Tonka beans, &c.
3. Substances used mechanically, as Teazels, Dutch Rushes, &c.
4. Seeds and fruits used for Ornamental purposes, as *Genivus* Beans, the Ivory Nut, the Doom Palm, Coquilla Nuts, bottle Corns, &c.

## ANIMAL.

## J. FOR TEXTILE FABRICS AND CLOTHING.

1. Wool, Hair, Bristles, Whiskers.
2. Silk from the Silk-worm *Bombyx mori*, and from other species in India, e. g. *Bombyx Cythia* and *Attacus Papilio*.
3. Feather, Down, Fur, Skins.
4. Miscellaneous.

## K. FOR DOMESTIC OR ORNAMENTAL PURPOSES, OR FOR THE MANUFACTURE OF IMPLEMENTS.

1. Bone, Horn, Hoofs, Ivory, Tortoiseshell, Shagreen, Quins.
2. Pearls, Mother-of-Pearl, Coral, and Shells generally.
3. Oils, Tallows, Spermaceti, Wax, Lard.
4. Miscellaneous, as sponge, Goatskin, Catgut, Silkworm-gut, Bladders, &c.

## L. AS AGENTS IN THE MANUFACTURE OF VARIOUS ARTICLES.

1. Glue, Isinglass, Gelatine, Bone-black, Ivory black, Animal Charcoal.

## M. FOR THE PRODUCTION OF CHEMICAL SUBSTANCES.

- Blood, Horns, &c., for the production of Phosphorus, the Prussiates, the Superphosphates, &c.

## N. FOR PIGMENTS AND DYES.

1. Cochineal and Carmine.
2. Dyes from the Galls of the Aphide.
3. Gall-sone, pigment from Ox-gall.
4. Indian Dyes from the Coccus, the various kinds of Lac.
5. Miscellaneous, as Sepia, Eucra d'Orient, &c.

## MACHINERY.

## V. Machines for direct use, including Carriages and Railway and Naval Machinery.

## A. STEAM ENGINES AND BOILERS, WATER AND WIND MILLS, AND VARIOUS OTHER POWER MOVES.

1. Boilers.
2. Land Locomotives.
3. Marine Engines.
4. Windmills.
5. Water-wheels and Turbines.
6. Water-pressure Engines, as Richenback's and Armstrong's.
7. Vacuum Power Engines.
8. Electro-Magnetic Engines, &c.
9. Miscellaneous.

## B. SEPARATE PARTS OF MACHINES, SPECIMENS OF WORKMANSHIP. (See also WATER and GAS WORKS in VII.)

1. As heavy Castings or Forgings in the rough; Castings or Forgings, plain, intricate, or beautiful, in the rough.
2. Specimens of Turning in Metals.
3. Specimens in filing and finished Work in Metals, such as Surfaces, Irregular Figures, &c.
4. Valves, Cocks, Pistons, Overdoors, &c.

## C. PNEUMATIC MACHINES.

1. Air Pumps.
2. Blowing Fans.
3. Blast Engines for Furnaces, &c.
4. Miscellaneous.

## HYDRAULIC MACHINES, CRANES, ETC., PILE DRIVERS, ETC. (See also VII.)

1. Hydraulic Machines—Pumps and Fire Engines. Water Motors. Hydraulic Presses, &c. Water-meters, &c.
2. Cranes—

Any sort of Crane motion and contrivances, Jacks of all sorts. (For Windlasses, Capstans, and Blocks, see VIII. E.)

3. Piling Engines.—(See also VII. A.) By hand power, or steam. Pile Sawing Machines. Pile Extractors, &c.

## LOCOMOTIVES AND RAILWAY CARRIAGES, &amp;c.

1. Railway Locomotives.
2. Common Road Locomotives.
3. Railway Carriages, Trucks, and Waggon.
4. Railway Velocipedes, &c. &c., of all sorts.
5. Atmospheric Railway Apparatus.
6. Carriage Brakes.
7. Buffers, Couplings, &c.

## RAILWAY MACHINERY AND PERMANENT WAY.

1. Permanent Way complete.
2. Sleepers.
3. Chairs, &c.
4. Rails.
5. Switches.
6. Turntables.
7. Station Arrangements.
8. Signals.
9. Miscellaneous.

## WEIGHING, MEASURING, AND REGISTERING MACHINES, FOR COMMERCIAL AND NOT FOR PHILOSOPHICAL PURPOSES.

1. Commercial Weighing Instruments.
2. Instruments of Measure.
3. Registering Instruments, Gauges, Indicators, and Tell-tales.

## A. Carriages generally—not including those connected with Rail or Tram Roads.

## FOR TOWN USE.

- Dress Vis-à-Vis.
- Dress Coach.
- Dress Chariot.
- Landau.

- Landaulet.
- Step-piece.
- Barouche.
- Sociable.

## TRAVELLING CARRIAGES.

- Coach.
- Dressing Coach.
- Chariot.
- Britska Chariot.
- Dormeuse, Post Chariot.
- Post Chariot.

- Britska.
- Drytška.
- Férigon.
- Mvalid Carriage.
- Sledges, &c.

## FOR GENERAL USE.

- Basterna.
- Brougham.
- Double Brougham.
- Clarence.
- Plenium.
- Carriage.
- Dormeuse.
- Dressing Phaeton.
- Mail Phaeton.
- Chariot Phaeton.
- Park Phaeton.
- Pony Phaeton.

- Curricie.
- Cabriolet.
- Headed Chase.
- Tisbury.
- Stanhope.
- Déanet.
- Gla.
- Irish Car.
- Dog Car.
- Pony Chair.
- Invalid Bath Chair.
- Velocipedes.

## D. PUBLIC CARRIAGES.

- Mail Coach.
- Stage Coach.
- Omnibus.
- Hackney Coach.
- Hackney Chariot.
- Glass Coach.

- Hansom's Cab.
- Street Cab.
- Fly.
- Clearse.
- Caravan.

## E. CARTS AND WAGGONS OF ALL KINDS, NOT BEING AGRICULTURAL.

## VI. Manufacturing Machines and Tools, or systems of Machinery, Tools, and Implements employed for the undermentioned purposes.

## A. MANUFACTURES OF ALL SPUN, WOVEN, FELTED, OR LAIN FABRICS.

1. Machinery for the complete formation from the Raw Material of all Fabrics of Cotton, Wool, Flax, Hemp, Silk, Caoutchouc, Gutta Serena, Hair.
2. Paper-making and Staining.
3. Printing and Bookbinding.

## B. MANUFACTURES OF METALS.

1. The manufacture of Metals from the Ore into Bars, Rods, Wire, Sheets, and other general forms; also casting and polishing of Metal, &c.
2. The cutting and working of Metals by Machine Tools, such as Lathes; Machines for Planing, Drilling, Boring, Slotting, Sawing, Stamping, Shearing, Riveting, Punching.
3. Machines and Tools used by the Makers of Gold, Silver, and Plated Goods.
4. Machines and Tools used by the Makers of Cutlery, Nails, Screws, Pins, Needles, Buttons, and metallic Pins, &c.
5. Machines and Tools used by Locksmiths, Die-sinkers, &c.

## C. MANUFACTURES OF MINERAL SUBSTANCES AND MINING MACHINERY. (See also SECTION I.)

1. Machines and Tools for the preparation and working of all kinds of Glass, Stone, Granite, Alabaster, Slate, Clay, &c.
2. Machines and Tools used in the preparation and working of Gems, &c.

## D. MANUFACTURES OF VEGETABLE SUBSTANCES.

1. Machines and Tools for the preparation and working of all kinds of Wood.
2. Mills and other machinery for Grinding, Crushing, or preparing Vegetable Products.

## E. MANUFACTURE OF ANIMAL SUBSTANCES.

- Machinery and Tools for working in Horn, Ivory, Leather, &c.

## F. MACHINERY AND APPARATUS FOR BREWING, DISTILLING, AND MANUFACTURING CHEMISTRY.

## VII. Civil Engineering, Architectural and Building Contrivances.

## A. FOUNDATIONS AND BUILDING CONTRIVANCES CONNECTED WITH HYDRAULIC WORKS.

1. Application of the Screw Pile, for the Foundations of Piers, Jetties, &c.; Beacons, and Ships' Moorings.
2. Pneumatic Piling, Machinery illustrative of the mode of sinking and guiding the Cylinders, also Contrivances for overcoming difficulties when obstructions are offered to their sinking.
3. Cofferdams on soft and rocky bottoms, and Apparatus connected with them.
4. Foundations of Lighthouses exposed to the violent action of the sea.
5. Diving-bells, Helmets, and Apparatus connected with them.
6. Boring Tools, and Contrivances for ascertaining the stratification of Sites of intended Structures.

## B. SCAFFOLDING AND CENTERING.

1. Scaffolding for the erection of Brick Chimney Shafts, Columns of Masonry, Towers, and Spires.
2. Portable Scaffolding, Ladders, and Fire Escapes.
3. Scaffolding for the erection of Monolithic Blocks, as Obelisks, &c., and for the hoisting of great Weights.

4. Fixed and Turning Scaffolding for the repairs, &c., of Domes, &c., internally and externally.
  5. Scaffolding and Contrivances for the erection of large Girder Bridges (as Britannia Bridge).
  6. Contrivances for Arched Bridges, Domes, and Vaults.
  7. Contrivances for Tunnels, Shields, and Contrivances for facilitating their excavation.
- C. BRIDGES, TUNNELS, AND ENGINEERING CONTRIVANCES FOR CROSSING RIVERS, RANGES, &c.**
1. Timber Bridges.
  2. Cast-iron Bridges.
  3. Wrought-iron Bridges (Girder or Lattice).
  4. Turning or Swing Bridges.
  5. Lifting or Bascule Bridges.
  6. Draw and Rolling Bridges.
  7. Suspension Bridges.
  8. Temporary Bridges. (See also VII. M.)
  9. Floating Bridges, as across the Namooze, and to receive Railway Trains, as across the Humber.
  10. Examples of Brick and Stone Bridges.
- D. DOCK, HARBOUR, RIVER, AND CANAL WORKS.**
1. Docks and Slips for the building and repairing of Ships.
  2. Mercantile Docks, and Arrangements connected therewith, for the loading and unloading of Ships.
  3. Sea and Canal Locks, Gates and Entrances, Stop-gates, Sluices, &c.
  4. Marine Railway Slips and Hydraulic Docks.
  5. Harbours of Refuge.
  6. Breakwaters, Piers, Jetties, Wharfs, and Landing-piers.
  7. Groynes, Sea-defences, &c.
  8. Perpendicular Lifts for Canals, and other Engineering Contrivances instead of Locks.
  9. Dredging-machines, Hedgehogs, and other Machines employed in Harbour Works, for removing Shoals, &c.
- E. LIGHTHOUSES AND BEACONS.**
- F. ROOFS, BUILDINGS, AND CONTRIVANCES FOR COVERING LARGE AREAS.**
1. Examples of Timber and Iron Trusses.
  2. Roofs for Markets, Railway Stations, &c.
  3. Roofs for Theatres.
  4. Fire-proof Buildings, arranged so as to be applicable to the economical methods of construction.
  5. Coverings for Roofs.
- G. WATERWORKS AND THE ENGINEERING CONTRIVANCES CONNECTED WITH THE OBTAINING, STORING, AND DISTRIBUTION OF WATER IN TOWNS.**
1. Well-sinking and Boring, and the Apparatus connected therewith.
  2. Storing, Filtering, and Distributing Reservoirs, and the Contrivances connected with them.
  3. Contrivances for maintaining and producing efficient Heads, and the Apparatus connected with Street Mains.
  4. Services, and Apparatus connected with Domestic Water Supply. (See also V., B.)
- H. GASWORKS, AND CONTRIVANCES CONNECTED WITH THE ECONOMICAL PRODUCTION OF ARTIFICIAL LIGHT.**
1. Retorts and Distillatory Apparatus.
  2. Condensing, Separating, and Purifying Apparatus.
  3. Governors and Station Motors.
  4. Gauges, Valves, and contrivances connected with the Mains for the Distribution of Gas. (See also XXII.)
- I. SEWERAGE, CLEANSING, PAVING, AND THE CONTRIVANCES CONNECTED WITH THE SANITARY CONDITION OF TOWNS.**
1. Forms of Sewers, their Entrances and Junctions.
  2. Contrivances for Cleansing, Flushing, and Ventilating Sewers.
  3. Contrivances for removing and discharging Sewage.
  4. Traps, and other Means of preventing emanations. (See also XXII.)
  5. House Drains, and the internal Sanitary arrangements of Houses. (See also XXII.)
  6. Pavements.
- J. WARMING AND VENTILATING DOMESTIC RESIDENCES AND THE CONTRIVANCES CONNECTED THEREWITH.**
1. Arrangements for Warming, as with Hot Air, Water, Steam, &c.
  2. Contrivances for preventing Smoke, and Chimney-sweeping Machines.
  3. Contrivances for Ventilation on a large Scale.
- K. MISCELLANEOUS.**
- VIII. NAVAL ARCHITECTURE, MILITARY ENGINEERING; ORDNANCE, ARMOUR, AND ACCOUTREMENTS.**
- A. ILLUSTRATIONS BY MODELS OF SHIPBUILDING FOR PURPOSES OF COMMERCE.**
1. Ships.
  2. Barks.
  3. Frigs and Brigantines.
  4. Snobs and Ketches.
  5. Schooners.
  6. Sloops and Cutters.
  7. Luggers, Barges, &c.
- B. ILLUSTRATIONS BY MODELS OF SHIPBUILDING FOR PURPOSES OF WAR.**
1. Ships of the Line.
  2. Frigates.
  3. Sloops, Corvettes, and Brigs.
  4. Cutters, Brigantines, Ketches, Schooners, Barges, &c.
  5. Bomb or Mortar Vessels, Fire-ships, Gun-boats, &c.
- C. ILLUSTRATIONS BY MODELS OF SHIPBUILDING FOR THE APPLICATION OF STEAM OR OTHER POWERS.**
1. Great War Steamers.
  2. Steam-vessels of large burden for long Passages.
  3. Steam-vessels for inland, River, or Lake Navigation.
  4. Sailing-vessels fitted for the temporary appliance of Steam or Human Power.
  5. Miscellaneous.
- D. VESSELS USED FOR AMUSEMENT, AND SMALL VESSELS, GENERALLY.**
1. Seagoing Yachts of all kinds.
  2. River Yachts, and Pleasure Boats, of a smaller class.
  3. Rowing Boats of all kinds.
  4. Fishing Boats and Vessels.
  5. Life Boats and Paddle-box Boats.
- E. RIGGING, ANCHORS, WINDLASSES, CAPSTANS, SHEATHING, AND ARTICLES CONNECTED WITH PRACTICAL SEAMANSHIP AND THE SAVING OF LIFE FROM SHIPWRECK.**
- F. INFANTRY ARMY-CLOTHING AND ACCOUTREMENTS.**
- G. CAVALRY ARMY-CLOTHING AND ACCOUTREMENTS.**
- H. CAMP EQUIPAGE, SUCH AS MARQUEES, TENTS, &c.**
- I. NAVAL GUNNERY, AND WEAPONS OF ATTACK AND DEFENCE MORE ESPECIALLY ADAPTED TO NAVAL PURPOSES.**
- J. ARTILLERY EQUIPMENTS, BOTH IN GARRISON AND THE FIELD, MACHINES FOR MOUNTING AND DISMOUNTING ORDNANCE.**
1. Garrison Equipments.
  2. Field Equipments.
  3. Machinery for Mounting, Dismounting, and Transporting Ordnance, Carriages, &c.
- K. ORDNANCE AND PROJECTILES.**
1. Guns.
  2. Howitzers.
  3. Mortars.
  4. Shot, Shells, and other Projectiles.
- L. SMALL ARMS.**
1. Rifles.
  2. Muskets.
  3. Carbines.
  4. Pistols.
  5. Lances.
  6. Swords.
  7. Bayonets.
  8. Cartridges.

## APPENDIX A 1.

U. MILITARY ENGINEERING, FIELD EQUIPMENTS, METHODS  
OF PASSING RIVERS AND OTHER OBSTACLES, THE  
ATTACK AND DEFENCE OF FORTRESSES, AND FIELD  
FORTIFICATION.

1. Field Engineer Equipments
2. Military Bridges, Pontons, Rafts, Boats, &c.
3. Field Fortification and Materials used in the Attack and defence of Fortresses.
4. Permanent Fortification.

### IX. Agricultural and Industrial Experiments.

## 2. IMP. EVENTS FOR TILLAG.

1. Ploughs, including Subsoil Ploughs and Pulverisers.
2. Harrows
3. Scarifiers, Cultivators, and Grubbers.
4. " and Crushers and Norwegian Harrows.
5. Rollers.
6. Digging and Trenching Machines.

**B, DRILLING, SOWING, MANURING, AND HOEING MACHINES.**

1. Pressers.
2. Drills.
3. Dibblers.
4. Horse Hoes.
5. Broadcast Sowing Machines.
6. Contrivances connected with the Distribution of Manure.

### 3. HADV: STING MACHINE

1. Machines for Cutting Corn or Grass.
2. Tedding Machines for Hay.
3. Rakes for Hay, Corn, Stubble, &c.

## D. BARN MACHINERY.

1. Steam Engines and Water power Machines.
2. Horse Work.
3. Threshing Machines.
4. Straw Shakers.
5. Winnowing, Corn Cleaning, and Sley Hammering.
6. Crushing and Splitting Mills.
7. Flour and Meal Mills.
8. Chaff Cutters.
9. Corn Weighing Machines and Measures.
10. Horse Brushes and Cutters.
11. Chaffery Cutter.
12. Cider Presses.

**E. FELLOWSHIP AND LARD MACHINERY.**

1. Turnip-cutters.
2. Root Chaffing and Squeezing Machines.
3. Potato-washers.
4. Steaming Apparatus.
5. Feeding Apparatus.
6. Weighing Machines for Cattle, &c (See G. V.)
7. Watering Engines, for Fire or Garden Purposes.  
(See D. V.)

Contingencies connected with the Stack-yard and Storing.

9. Contrivances, for Fencing, Folding, &c.  
10. Fittings for Stables, Cow-houses, &c.

AGRICULTURAL CHAIRMAN, HARNLEY, AND GEAR.

- 1 Waggon, Car, &c.
- 2 Brakes.
- 3 Separate parts as Wheels, Axles, &c.
- 4 Harness and Gear.

7. Der unveränderte Satz.

1. Machines for making Pipes, Tiles, and Bricks.
2. Ingredients for Draining, and Tools.
3. Tiles, Pipes, and other Materials used in draining.
4. Scoop Wheel and other Machines used in Draining or Lifting Water.
5. Machines and Conduits used for Irrigating Lands.
6. Sluices, Draw Gates, &c.

### H. DAILY IMPLEMENTS.

1. Churns.
2. Cheese-presses.
3. Miscellaneous contrivances used in the Dairy.

MISCELLANEOUS IMPLEMENTS USED IN AGRICULTURE.

1. Rick Ventilator.
2. Ladders.
3. Pitch and Tar Melters.
4. Sheep-dipping Apparatus.
5. Farm Railway.

7. Alarm Guns for protecting Crops.
8. Beehives.
9. Instruments for Cattle, Probangs, &c.
10. Tree Remover.
11. Various Miscellaneous Articles.

**J. GALDEN ENGRAYS AND TOOLS**

X. Philosophical Instruments and Processes depending upon their use: Mineral, Historical, and Surgical Instruments.

### A. INSTRUMENTS FOR THE MEASUREMENT OF SPACE

1. In fixed observatories, as Transits, Transit Circles, great Quadrants, Mural Circles, Zenith Sectors, Altimeters, Equatoria, Collimators, &c.
2. For Nautical Astronomy and Observations, as Sextants, Reflecting and Repeating Circles, Dip Sectors, &c.
3. Astronomical and Topographical Illustrations, as Globes, Orreries, Planetariums, Maps, Charts, &c.
4. Optical Instruments, as great Refracting and Reflecting Telescopes, with their appendances, equatorial motions, &c.
5. Apparatus subordinate to graduated Instruments, as divided Object Glasses and Heliometers, Eyepieces, Micrometers, Micrometer Microscopes, &c.
6. Survey Instruments.
  - a. Topographical, as Baro apparatus, Theodolites, Repeating Circles, Geodetic Signals, Levelling Apparatus, Miners' and Prismatic Compasses, Pocket Sextants, Perambulators, Podometer
  - b. Hydrographical, as Sounding Machines, Patent Log, Current Meters, Siderometers

## B INSTRUMENTS TO MEASURE THE EFFECTS OF MECHANICAL AND PHYSICAL FORCES.

- 1 Mechanical, as Dynamometers, Tachometers
- 2 Mga. (Weighing Instruments, as Weighing  
Machine, Scales, Chemical and Assay Balances
- 3 Density, as Acometers and other Instruments to  
determine Specific Gravity, Invariable Pendu-  
lums, Atwood's Machine
- 4 To measure other Physical Effects, including Me-  
teorological Instruments, as Barometers, Hydro-  
meters, Hydrometers, Thermometers, Pyro-  
meters, Librometers, Rheometers, and Metro-  
meters, &c.

### C. INSTRUMENTS TO ILLUSTRATE THE LAWS OF MECHANICS AND PHYSICAL SCIENCE.

1. "Kinematics," Instruments to exhibit and describe Motions and their Combinations, as Compasses, Penographs, Instruments for describing Angular and other Figures, &c.
2. Mechanics, or Instruments to illustrate the Laws of Static and Dynamic Forces.
  - a. Static Mechanics, as for illustrating Mechanical Powers, accelerated and retarded Motion, Equilibrium and Parallelogram of Forces, Levers, Cathetometers, Centripetal and Centrifugal Forces, Elasticity, &c.
  - b. Hydro-Mechanics, as Instruments to illustrate the motion and Impinging Force of Waves, &c.
  - c. Pneumatic Mechanics, as Apparatus connected with the Air-Pump, &c.
3. Instruments to illustrate the Laws of Corpuscular Force, as Wrought's Planes, Endosmometers,

4. 1. 3. 4. 5. 6. 7. 8. 9. 10. 11. 12. 13. 14. 15. 16. 17. 18. 19. 20. 21. 22. 23. 24. 25. 26. 27. 28. 29. 30. 31. 32. 33. 34. 35. 36. 37. 38. 39. 40. 41. 42. 43. 44. 45. 46. 47. 48. 49. 50. 51. 52. 53. 54. 55. 56. 57. 58. 59. 60. 61. 62. 63. 64. 65. 66. 67. 68. 69. 70. 71. 72. 73. 74. 75. 76. 77. 78. 79. 80. 81. 82. 83. 84. 85. 86. 87. 88. 89. 90. 91. 92. 93. 94. 95. 96. 97. 98. 99. 100. 101. 102. 103. 104. 105. 106. 107. 108. 109. 110. 111. 112. 113. 114. 115. 116. 117. 118. 119. 120. 121. 122. 123. 124. 125. 126. 127. 128. 129. 130. 131. 132. 133. 134. 135. 136. 137. 138. 139. 140. 141. 142. 143. 144. 145. 146. 147. 148. 149. 150. 151. 152. 153. 154. 155. 156. 157. 158. 159. 160. 161. 162. 163. 164. 165. 166. 167. 168. 169. 170. 171. 172. 173. 174. 175. 176. 177. 178. 179. 180. 181. 182. 183. 184. 185. 186. 187. 188. 189. 190. 191. 192. 193. 194. 195. 196. 197. 198. 199. 200. 201. 202. 203. 204. 205. 206. 207. 208. 209. 210. 211. 212. 213. 214. 215. 216. 217. 218. 219. 220. 221. 222. 223. 224. 225. 226. 227. 228. 229. 230. 231. 232. 233. 234. 235. 236. 237. 238. 239. 240. 241. 242. 243. 244. 245. 246. 247. 248. 249. 250. 251. 252. 253. 254. 255. 256. 257. 258. 259. 260. 261. 262. 263. 264. 265. 266. 267. 268. 269. 270. 271. 272. 273. 274. 275. 276. 277. 278. 279. 280. 281. 282. 283. 284. 285. 286. 287. 288. 289. 290. 291. 292. 293. 294. 295. 296. 297. 298. 299. 300. 301. 302. 303. 304. 305. 306. 307. 308. 309. 310. 311. 312. 313. 314. 315. 316. 317. 318. 319. 320. 321. 322. 323. 324. 325. 326. 327. 328. 329. 330. 331. 332. 333. 334. 335. 336. 337. 338. 339. 340. 341. 342. 343. 344. 345. 346. 347. 348. 349. 350. 351. 352. 353. 354. 355. 356. 357. 358. 359. 360. 361. 362. 363. 364. 365. 366. 367. 368. 369. 370. 371. 372. 373. 374. 375. 376. 377. 378. 379. 380. 381. 382. 383. 384. 385. 386. 387. 388. 389. 390. 391. 392. 393. 394. 395. 396. 397. 398. 399. 400. 401. 402. 403. 404. 405. 406. 407. 408. 409. 410. 411. 412. 413. 414. 415. 416. 417. 418. 419. 420. 421. 422. 423. 424. 425. 426. 427. 428. 429. 430. 431. 432. 433. 434. 435. 436. 437. 438. 439. 440. 441. 442. 443. 444. 445. 446. 447. 448. 449. 450. 451. 452. 453. 454. 455. 456. 457. 458. 459. 460. 461. 462. 463. 464. 465. 466. 467. 468. 469. 470. 471. 472. 473. 474. 475. 476. 477. 478. 479. 480. 481. 482. 483. 484. 485. 486. 487. 488. 489. 490. 491. 492. 493. 494. 495. 496. 497. 498. 499. 500. 501. 502. 503. 504. 505. 506. 507. 508. 509. 510. 511. 512. 513. 514. 515. 516. 517. 518. 519. 520. 521. 522. 523. 524. 525. 526. 527. 528. 529. 530. 531. 532. 533. 534. 535. 536. 537. 538. 539. 540. 541. 542. 543. 544. 545. 546. 547. 548. 549. 550. 551. 552. 553. 554. 555. 556. 557. 558. 559. 560. 561. 562. 563. 564. 565. 566. 567. 568. 569. 570. 571. 572. 573. 574. 575. 576. 577. 578. 579. 580. 581. 582. 583. 584. 585. 586. 587. 588. 589. 590. 591. 592. 593. 594. 595. 596. 597. 598. 599. 600. 601. 602. 603. 604. 605. 606. 607. 608. 609. 610. 611. 612. 613. 614. 615. 616. 617. 618. 619. 620. 621. 622. 623. 624. 625. 626. 627. 628. 629. 630. 631. 632. 633. 634. 635. 636. 637. 638. 639. 640. 641. 642. 643. 644. 645. 646. 647. 648. 649. 650. 651. 652. 653. 654. 655. 656. 657. 658. 659. 660. 661. 662. 663. 664. 665. 666. 667. 668. 669. 670. 671. 672. 673. 674. 675. 676. 677. 678. 679. 680. 681. 682. 683. 684. 685. 686. 687. 688. 689. 690. 691. 692. 693. 694. 695. 696. 697. 698. 699. 700. 701. 702. 703. 704. 705. 706. 707. 708. 709. 710. 711. 712. 713. 714. 715. 716. 717. 718. 719. 720. 721. 722. 723. 724. 725. 726. 727. 728. 729. 730. 731. 732. 733. 734. 735. 736. 737. 738. 739. 740. 741. 742. 743. 744. 745. 746. 747. 748. 749. 750. 751. 752. 753. 754. 755. 756. 757. 758. 759. 760. 761. 762. 763. 764. 765. 766. 767. 768. 769. 770. 771. 772. 773. 774. 775. 776. 777. 778. 779. 780. 781. 782. 783. 784. 785. 786. 787. 788. 789. 790. 791. 792. 793. 794. 795. 796. 797. 798. 799. 800. 801. 802. 803. 804. 805. 806. 807. 808. 809. 810. 811. 812. 813. 814. 815. 816. 817. 818. 819. 820. 821. 822. 823. 824. 825. 826. 827. 828. 829. 830. 831. 832. 833. 834. 835. 836. 837. 838. 839. 840. 84

D. APPLICATION OF MECHANICAL AND PHYSICAL SCIENCE  
TO USEFUL PURPOSES, NOT INCLUDED IN ANY OF  
THE PRECEDING OR SUBSEQUENT SECTIONS.

2. Mechanics.  
 a. Stereo-Mechanics when not included in Section describing their more extended uses.  
 b. Hydro-Mechanics  
 c. Pneumo-Mechanics as Air Pumps, Rarefying and Condensing, Diving Bells, Air Balloons, &c.  
 &c.

- 2 Sound (not including Musical Instruments)**  
 a Instruments to assist Hearing  
 b Alarms Bells  
 c Models of Acoustical Buildings, &c
- 3 Light—Instruments to assist Vision, as smaller Telescopes, Opera Glasses, Spectacles, Microscopes, Lenses, Mirrors, Signals, Visual Telegraphs, Light-houses, Optical Illusions, Gas and Solar Microscopes, Cameras, Photography, Polarization of Light, &c**
- 4 Heat—Apparatus for producing Heat, for Freezing, Thermostats, Burning Lenses, and Mirrors &c**
- 5 Magnetism and Electricity—Machines' Composites, Electric and Electro-Magnetic Telegraphs, Electric Light, applications of Electro-Magnetism as a Motive Power, Therapeutic Applications of Electricity, Electrotypes Apparatus, and Space means, &c**
- I CHEMICAL AND PHARMACEUTICAL APPARATUS**
- I MISCELLANEOUS**
- X a Musical Instruments &c**

**X b Hoary**

- A GREAT CLOCKS FOR CHURCHES, CASTLES, STABLES, AND PUBLIC BUILDINGS IN GENERAL**
- 1 With three and four wheel trains
  - 2 With Remontones and with various Escapements
  - 3 To strike the Hours, and the Hours and Quarters
  - 4 The various Compensation Pendulums in use
  - 5 The various modes of making the work to carry the Hand, and communicating the motion from the Clock to the Hands
  - 6 Electric or Magneto-Electric Clocks
- B ASTRONOMIC CLOCKS**
- 1 The various Escapements employed
  - 2 The various Compensation Pendulums used
  - 3 Equatorial Clocks
  - 4 Clocks, commonly called Journeymen Clocks, for Observatories
- C CLOCKS APPLIED TO REGISTRATION**
- 1 To register the Barometer daily for twelve months, or other periods
  - 2 To register Tides and Winds
  - 3 To register the punctual attendance of Watchmen and others
- D CLOCKS SHOWING DISTANT PHENOMENA**
- 1 Cycle of the Sun and Moon, Eclipses, Moon's Age, Equation of Time, the Golden Number, Tides, &c.

**E CLOCKS FOR THE COMMON PURPOSES (LIST)**

- 1 Weight Clocks
- 2 Spring Clocks with Pendulum
- 3 Balance Clocks of various descriptions

**F CLOCKS AND TIME PIECES IN DISPOSITION (LIST), COMMONLY CALLED ORNAMENTAL CLOCKS, FOR DRAWING-ROOMS, LIBRARIES, &c**

- 1 In Metal Cases (Gilded and Lacquered)
- 2 In Brd Cases
- 3 In Wood Cases
- 4 In China Cases

**G SECONDARY APPLICATIONS TO CLOCKS**

- 1 The various modes by which Clocks are kept going while being wound
- 2 The various escapements employed in Clocks of different descriptions
- 3 Various portions of Mechanism forming parts of or applicable to Clocks

**H MARINE CHRONOMETERS**

- 1 1 day
- 2 2 day
- 3 Thirty hour
- 4 The various descriptions of Compensation Balances applied to Chronometers
- 5 The various descriptions of Pendulum Springs applied to Chronometers
- 6 Pocket Chronometers

**I POCKET WATCHES OF VARIOUS DESCRIPTION**

- 1 For measuring Minute Portions of Time in registering Observations
- 2 With Compensation Balances
- 3 Duplex Escapement
- 4 With Horizontal Escapement
- 5 Lever escapement upon different constructions
- 6 The old original Vertical Escapement
- 7 Repeating upon different constructions to strike the Hours and Quarters
- 8 The same to strike the Hours, Quarters, and Half Quarters
- 9 The same to strike the Hours, Quarters and Minutes
- 10 Clock watches to strike the Hours and Quarters in a similar manner to Clock
- 11 Clock watches, and in addition, Repeating
- 12 Watches with Alarms
- 13 Watches known by the denomination of Indian Watches, with the case operated in various ways
- 14 Various portions of Mechanism forming parts of Watches

**J WATCHES FOR DIFFERENT MARKETS**

- 1 As for Turkey with three Cases and Turkish Dial
- 2 Long hand with peculiar Cases and Dials
- 3 For India and South America
- 4 For Home Country Districts

**K MISCELLANEOUS****X c Surgical Instruments****A FOR OPERATIONS ON THE EYE****Special Instruments for**

- 1 Operation on the Eyelids
- 2 External Oculars
- 3 Strabismus
- 4 Artificial Pupil
- 5 Cataract
- By Depression
- By Extraction
- By Including, elevators in Silver and Iron
- By Histories, Hooks, Canulas, Stylets, Sponges, various Needles, &c
- By Cataract Knives, Hooks, Capsular Forceps, &c

**B OPERATIONS ON THE EAR****Special Instruments for**

- 1 Examination of the Aural and Auditory Passages
- 2 Sounds, Catheters, Speculum, &c
- 3 The Conveyance of Air or Liquid into the Tympanic Cavity
- 4 Pneumatic and other Syringes in Metal, Glass, and Caoutchouc, &c
- 5 The Removal of Foreign Bodies from the Mastoid, Incisors, Branch Forceps, &c

4. Perforation of, and other Operations on, the Membrana Tympani.
5. The Conduction of Sound.
  - a. Including all kinds of Acoustic Instruments and Contrivances, Ear Cornets, Speaking Trumpets, &c.

**C. OPERATIONS OF THE NOSE—NASAL FOSSE AND ANTRUM.**

**Special Instruments for—**

1. The Stem-Oval of Polypus.
  - a. Various Forceps, Porte-ligatures, Serre-nœuds, &c.
2. The Removal of Extraneous Substances.
3. The Arrest of Hemorrhage from the Posterior Nares.
  - a. Including all Contrivances for "Tamponement."
4. Exploration and Injection of the Maxillary Sinus.
  - a. Including Jourdain's Sounds, Canisters, &c.
5. Perforation and Injection of the Antrum.
  - a. Including Liston's Drills, Antrum Syringes, Plugs, &c.

**D. OPERATIONS ON THE MOUTH AND PHARYNX.**

**Special Instruments for—**

1. Hare Lip.
2. Operations on the Teeth (Dental Instruments).
3. Myotomy and Ligatures of the Tongue.
4. Cleft Palate and other Operations on the Roof of the Mouth (Staphylophagic Instruments).
  - a. Including Obturators, Cleft and Notched Needles, Palate Holders, Porte-Sutures, &c.
5. Excision of the Uvula and Tonsils.
6. Cauterization and other Operations on the Pharynx.
  - a. Tonsillar Guillotines, Pharyngotomes, &c.
7. Salivary Fistula.
  - b. Parotidæan Cannulas, Lenden Threads, &c.

**E. OPERATIONS ON THE TRACHEA AND RESPIRATORY ORGANS.**

**Instruments for—**

1. Tracheotomy and Laryngotomy.
  - a. Including Marshall Hall's Tracheotome, Sampson's Springs and Tubes, &c.
2. The Removal of Foreign Bodies from the Larynx, Trachea, and Bronchii.
3. Paracentesis Thoracis (Empyema).
4. Various Purposes.
  - a. Including Inhalers for the administration of Chloroform, Ether, and other Medicinal vapours.
  - b. Instruments used to restore Suspended Animation.
  - c. Respirators in all Materials.
5. Physical Examination of the Chest.
  - a. Instruments for Auscultation, Percussion, and Admeasurement of the Chest; Stethoscopes and Pleximeters in all materials; Spirometers and Stethometers, as suggested by Quain and Sibson, &c.

**F. OPERATIONS ON THE ABDOMINAL WALLS AND ALIMENTARY CANAL.**

**Special Instruments for—**

1. Stricture and other morbid states of the Oesophagus, the removal of Foreign Bodies, &c.
  - a. Including Oesophagus Bougies and Probes in elastic gum and other materials; Oesophagotomes, Guller's forceps, &c.
2. The introduction and withdrawal of Fluids from Stomach; the removal of Poison, &c.
  - a. The Stomach Pump and its appendages, Enema Syringes, &c.
3. The formation and maintenance of artificial Anus.
  - a. Enterotomes, Porte-Sutures, &c., by Dupuytren, Blandin, and others.
4. Prolapsus Ani.
  - a. All kinds of Rectum-Plugs, in caustic, elastic gum, &c.
5. Fistula, Fissures, and Vegetations in Ano.
  - a. Fistula Knives, Directors, &c.
  - b. Porte-ligatures (on Luke's and Sampson's plan).
6. Hernia.
  - a. Cutting instrument for the radical cure.
  - b. Trusses and all the usual means of support.
7. Paracentesis Abdominis.
8. Physical examination of the rectum.
9. Various Specimens (see Liston and others).

**G. OPERATIONS ON THE GENITO-URINARY SYSTEM IN THE MALE.**

**Instruments for—**

1. Lithotomy.
  - a. Including Lithotomes, (Forgets, Staff, Forceps, Scoops, &c.
2. Lithotripsy.
  - a. Lithotrites, which disintegrate the Stone by Perforation.
    - Ditto ditto by Concentric Pressure.
    - Ditto ditto by Percussion.
  - b. Syringes and other Instruments to inject and exploit the Bladder.
  - c. Dilators, Sliding-scoops, and Apparatus to remove Calculi impacted in the Prostate; Instruments for Lithostasy, &c.
3. Urinary Fistula.
  - a. Including all Urethroplastic Instruments, Urethrotomes, &c. for Recto-Urethral, Perineal, and Recto-Vesical Fistula.
4. Stricture, Psoatic and Vesical Disease, and retention of Urine.
  - a. Every variety of Catheter, Bougie, Sound, Porte-Cautiques, and Urinal, Curved Trucars for Puncture of the Bladder above the Pubes, through the Rectum, &c.
5. Phymosis.
  - a. Apparatus employed by Jews.
  - b. By the Profession.
8. Hydrocele.
7. Varicocele.
  - a. Including Instruments for obliteration of the Spermatic Veins (Ricord's), as well as those for simple support; Suspensory and other Bandages; Scrotal Rings, &c.

**H. OPERATIONS ON THE GENITO-URINARY SYSTEM IN THE FEMALE.**

**Instruments for—**

1. Exploration.
  - a. Including Speculums in all Materials, Sounds, Dilators, &c.
2. Operations on the Uterus, Vagina, and Cervix Uteri.
  - a. Hysterotomes and Instruments for Paracervical Uteri (Lefranç's and Simpson's). Uterine Scissors and dressing Forceps (curved and straight), Porte-Cautiques, &c.
3. Polypus Uteri.
  - a. Vulcella and other Forceps, Porte-ligatures, Serre-nœuds, &c.
4. Prolapsus and Pseudo-entia Uteri.
  - a. Including pessaries, Bandages, and artificial supports of all kinds.
5. Vesico-Vaginal Fistula and Recto-Vaginal Fistula.
  - a. Hancock's new Instruments, Urinary Receptacles, &c.
6. Obstetrical Purposes.
  - a. Including all Midwifery Instruments, and Contrivances to remedy Lacerated Perineum.

**I. OPERATIONS ON THE EXTREMITIES.**

**Special Instruments for—**

1. Amputations.
  - a. Army (portable) and Hospital Cases, &c.
2. The Adjustment of Fractures.
  - a. Including Splints, Inclined Planes, Pads, Slings, and Bandages, in all Materials.
3. The Reduction of Dislocations.
  - a. Pallets, Rings, Staples, &c.

**K. OPERATIONS ON THE OSSEOUS SYSTEM.**

**Special Instruments for—**

1. Trepanning.
2. Resection and Exarticulation.
3. The Extraction of Sequestra, &c.

**L. OPERATIONS ON THE VASCULAR SYSTEM.**

1. Venesection.
  - a. Cupping Instruments, Lancets, Leech-tubes, &c.
2. The Control of Hemorrhage.
  - a. Tourniquets, Compressors, Torsion Forceps, &c.
3. Transfusion.

4. **Andurism.**  
By Ligature:—a. Aneurism Needles, Porto-Burgues, Sampson's Speculum, &c.  
By Compression:—b. New Instruments, by Wyld, Bellingham, and others.
5. **Nævus.**  
a. Needles, Porto-aiguilles, &c. (Jadon's and Brodie's).
6. **Varices.**  
a. Including Elastic Bands, Stockings, Anklets, &c.
- M. ANTHROPLASTIC AND ORTHOPÆDIC OPERATIONS.**  
Special Instruments for—
1. The various Taliaottian Processes.

## MANUFACTURES.

## XI. Cotton.

## A. COTTON YARN AND THREAD.

1. Grey Twist in Hanks and Bobbins, from No. 20 to 600.  
White and Bleached Yarn.  
Dyed Yarn, assorted Colours.  
Turkey-red and Pink.
2. Cotton Thread—  
Two-fold Laze; 2/3, 4/6, and 9-cord sewings.  
Two-fold Laze; knittings.  
Crochet Cottons.  
Wire Thread.
3. Grape Yarn—  
Bleached.  
Coloured.

## B. CALICOES.

- Shoosings (Grey and Bleached) —  
and 3 Super.  
Shirtings (Grey and Bleached).  
Domestics.  
Madapolams—  
and 3, and 40-inch Printers'.  
Long-cloths (Plain and Twilled) —  
Imitation Irish.

## C. CORDS AND BEAVERTEENS.

1. 1/2 Cell and 1/2 Corded.  
Cords.  
Beaverteens.
2. Drabbeets.  
Twilleds.  
Fancy Drills.  
Grey Twills.

## Swansdowns.

J'ses.  
Ticks.

## 3. Velvets and Velvetoses.

## D. MUSLINS, &amp;c.

1. Cambric and Jacquinet —  
Mulls and Books.  
Bishop and Victoria Lawns, &c.  
Jacquinet, Organdy, Lenos, and Fancy Checks for Printing (Grey and Bleached).
2. Figured Muslins —  
Lappets, Lenos, and Nets, White and Dyed.  
Jacquard-made Goods.  
Lappets, Japan Spots and Honeycombs.  
Striped and Corded.  
Allover and Diagonal Spider.  
Bengal Scarf Spot, assorted.  
Harness, assorted.  
Garmets.  
Window Curtains.  
Spot.  
Book Jacquinet and Radca Lappets.  
Lenos, Plain.  
Figured.  
Small Stripe and Check Dorlans.  
Mexican Lappets, Coloured and White.  
Turkey Gauze, White and Dyed.
3. Shawls, Handkerchiefs, and Dresses —  
Imitation Cambric Handkerchiefs, Plain and Embroidered.  
Lappet Shawls.  
Book Muslin Dresses, Checks.  
Tapes and Cords.  
Book Handkerchiefs.  
Specimens of Madapolams.  
Bleached Goods of various Finishes.  
Cambric Finish.  
Jacquinet Finish.  
Book Muslins, Hard, Elastic, and London Finish.  
richly Ornamented.

Opussum  
Perewiazka

As for Muffs, Tippets, Linings, Cuffs, &c.

## 14. Hare and Rabbit

White Hare from Russia and the Polar Regions  
European or Grey Hare  
Hudson's Bay and North American Rabbit  
English Rabbit  
Flemish Rabbit  
Silver-grey Rabbit  
White Polish Rabbit  
Black and Blue Rabbit  
Australian Rabbit  
Dyed Rabbit

Muffs, Tippets, Linings, Cuffs, &c.

## 15. Lamb, &amp;c.

Grey Russian Crimean Lamb  
Black Ukraine Lamb  
Black Astrachan Lamb  
Persian Grey Lamb  
Persian Black Lamb  
Hungarian Lamb  
Spanish Lamb  
English Lamb

For general purposes of Dress.

## 16. Squirrel.

Black Russian  
Blue Siberian  
Kazan Siberian  
American Squirrel  
English Squirrel  
Indian Striped Squirrel  
Flying Squirrel  
Dyed Squirrel

For Ladies' wear, and for Muffs, Tippets, Cuffs, Linings, Trimmings, &c.

## 17. Chinchilla.

African Chinchilla  
Buenos Ayres Chinchilla  
Lima or bastard Chinchilla

As made into various articles of Ladies' Dress.

## 18. Cat.

Dutch Cat or Jennet  
European Cat  
Wild Cat  
African Cat

For Coat, Linings, Sleigh Coverings, Travelling Bags, &c.

## 19. Grebe

Elder Duck  
Penguin

For Ladies' use.

## 20. Tartar Goat

Angora Goat  
Dyed Goat

Various purposes.

## 21. Skins from the Tropics.

Lion  
Royal Tiger  
Cape Tiger  
 leopard  
Panther  
Zebra  
Antelope  
Black Monkey  
Ant-eater.

Mounted for ornamental purposes and for Furniture.

## 22. Miscellaneous—Moose Deer.

Deer.  
Roebuck.  
Badger; the hair of the European badger, as used for shaving-brushes, &c.

## E. FEATHERS.

## 1. Ostrich,

Aleppo  
Mogador  
Alexandria  
Senegal  
Cape  
Algoa Bay  
Dyed

As worn in Plumes on Court occasions by Knights of various Orders, and for Military purposes, also in their application to general Dress for Ladies and for Funeral Plumes.

- b. Table and Chair Covers, &c., worked in the same way.
- c. Patent Axminster Carpets, manufactured at Glasgow, made firstly as a woven Fringe, and that adapted afterwards to a thick Flax Surface.
- d. Patent Tapestry Carpet, Pattern printed in warp, any number of Colours used; Table-covers and Curtains made in same way.
- e. Patent Tapestry Rugs, Velvet Pile Surface, with a thick soft shoot of Cotton, Flax, or other material.
- f. Brussels and Velvet Pile Carpet.
- g. Tapestry Brussels Carpets, called Moquette, of a fine quality.
- h. Kidderminster and Venetian Carpets.
- i. Patent Mosaic Tapestry and Rugs, where the cut Wool is fixed to a ground by enclenchure, &c.
- j. Printed Fel Carpet, Plain and Printed Druggets, Printed and Embossed Cloth for Table-covers and Curtains.
- k. Patent Printed Carpet with Terry Pile Surface; the same Moquette for Curtains of Furniture.
- l. Cloth Embroidered by Machinery for Table-covers or Curtains.
- 2. Matting of Hemp, Cocoa-nut Fibre, Straw, Reeds, and Grasses, for Floor and Walls.
- 3. Oil-cloth for Floor or Table, whether painted or printed.
- 4. Woven or Embroidery, Crochet and Net Work.
- 5. Counterpanes and Quilts for Bed-covers; Quilting and Dimity for Bed-room Hangings.
- 6. Ornamental Tapestry of Silk, Wool, Linen, Mohair, Cotton, or of these materials mingled together, or with Metal Wires, whether woven in the Loom or of any kind of Needlework, but of Patterns having so much artistic excellence as to entitle them to be exhibited in Section XXX. as Works of Fine Art.

## B. LACE.

- 1. Pillow Lace, the article or fabric being wholly made by hand (known as Valenciennes, Mechlin, Honiton, Buckingham); or guipure made by the Crochet Needle; and Silk Lace, called "Blonde" when white, and Chantilly, Puy, Grammont, and Black Buckinghamshire when black.
- 2. Lace, the ground being Machine-wrought, the Ornamentation made on the Pillow and afterwards applied to the Ground (known as Brussels, Honiton, or appliqué Lace).
- 3. Machine-made Nets and Quillings, wholly Plain, whether Warp or Bobbin (known as Bobbin Net, Tulle, Blondes, Cambric, Mechlins, Melins, Brussels, Alençon, &c.)
- 4. Lace, the Ground being wholly made by Machine: partly Ornamented by Machine and partly by Hand, or wholly Ornamented by Hand, whether Tamboured, Needle-Embroidered, or Darned.
- 5. Lace actually Wrought and Ornamented by Machinery; comprising Trimming Laces of every description; Veils, Falls, Scarfs, Shawls, Lappets, Curtains, &c.

## C. SEWED AND TAMBOURED MESLINS.

- Ladies' Collars, Cuffs, &c.
- Children's Robes.
- Handkerchiefs.
- Trimnings and Insertions.
- Vest Pieces.
- Shirt Fronts.
- Mantles.
- Dresses.
- Curtains, &c.

## D. EMBROIDERY.

- 1. Gold and Silver and Glass.
- 2. Silk, as Shawls, Dresses, Mantles, Table Covers, and Curtains, &c.
- 3. Berlin Wool, Chair Covers and Fauty Articles for the Drawing-room.
- 4. Embroidery by Machinery.

## E. FRINGES, &amp;c.

- 1. Fringes, Tassels, Gimps, &c., suitable as Trimmings for Upholstery.
- 2. Ditto for Dresses and other fine Work.

## F. FANCY AND INDUSTRIAL WORKS.

- 1. Berlin Wool Work.
- 2. Needlework.
- 3. Miscellaneous Industrial Works.

## XX. Articles of Clothing for Inland or Domestic Use.

## A. HATS, CAPS, AND BONNETS.

- 1. Hats, made of Silk, Beaver, or other materials for Men.
- 2. Caps for Men.
- 3. Bonnets of Straw, Silk, or other material.
  - a. British Chip Bonnet made from the Poplar.
  - b. Willow Bonnet.
  - c. Brazilian Grass Hats.
  - d. Tuscan and Leghorn Painting and Bonnets.
  - e. Straw Plait Bonnets.
  - f. Straw Trimmings and Bonnets.
  - g. Horse-hair Trimmings and Bonnets.
  - h. Silk and other Bonnets made by Milliners.

## B. HOSIERY.

- 1. Cotton.
- 2. Woollen.
- 3. Linen.
- 4. Silk.

## C. GLOVES.

- 1. Made of Leather or Skins.
- 2. Made of any other materials.

## D. BOOTS, SHOES, AND LASTS.

- 1. Made of Leather.
- 2. Made of other materials.

## E. UNDER CLOTHING.

- 1. For Ladies.
- 2. For Gentlemen.

## F. UPPER CLOTHING.

- 1. For Ladies, including all kinds of Millinery.
- 2. For Gentlemen, including all kinds of Tailor's work.

## XXI. Cutlery and Edge-tools.

## A. CUTLERY, SUCH AS KNIVES AND FORKS, PEN AND POCKET KNIVES, RAZORS, SCISSORS, AND SHEARS.

- 1. Knives and Forks—
  - Table, Dessert, Carving.
  - Dessert or Fruit, with plated and silver blades.
  - Cake and Melon Carvers, " "
  - Fish Knives and Forks, " "
- 2. Spring Knives—
  - Pen and Pocket Knives of every description.
  - Hunting and Sportsmen's Knives.
- 3. Knives of all other descriptions—
  - Paper Knives of all kinds.
  - Desk or Office Knives.
  - Palette Knives.
  - Knives for Hunting and Self-defence, as Couteaux-de-Chasse, Bowie Knives, &c.
  - Knives for Kitchen and Domestic Purposes, as "Books", Oyster, Onion, Bread and Butter, and Cheese Knives.
  - Knives used in various Trades, as Butchers', Shoe-makers', Glaziers', Gardeners', &c.
- 4. Scissors and Shears—
  - Ladies' Work and Cutting-out Scissors of every description.
  - Nail, Button-hole, Barber's, and Trimming Scissors.
  - Shears used in various Trades, as Tailors', Brush-makers', &c.
  - Garden and Sheep Shears.
- 5. Razors of all kinds.
- 6. Miscellaneous
  - Corkscrews, Button-hooks, Boot-hooks, Nail-nippers, Nail-files, Tweezers, &c.

## B. FILES AND OTHER SMALL EDGE TOOLS, NOT INCLUDED IN MANUFACTURING TOOLS IN SECTION VI.

- 1. Files and Edge-tools used by Engineers, Smiths, or other Metal Workers.
- 2. " for purposes of Building, by Masons, Bricklayers, and Plasterers.
- 3. " for fine metal and other work, as for Clock and Watch makers, Jewellers, Lapidaries, Engravers, and Modellers.
- 4. " for Wood-work, as for Carpenters, Joiners, Cabinet-makers, Coopers, &c.
- 5. " for Leather or Skins, as for Saddlers, Curriers, Shoemakers, and Bookbinders.
- c. Drawing, Artists' and Engraving Instruments.
- 7. Files and Edge-tools for other purposes than those specified.

XXII. Iron and General Hardware.

A. BRASS MANUFACTURE.

1. Cabinet and general Brass Foundry, consisting of Hinges, Fastenings, Escutcheons, Bell-pulls, Brass-foundry used in Ships, Knockers, Door-springs, Castors, &c.
2. Plumbers' Brass Foundry, Cocks, Valves, Pumps, Water-Closets, &c.
3. Stamped Brass Foundry, Cornices, Curtain-bands, Finger-plates, &c.
4. Gas-fittings, Brackets, Chandeliers, Pillars, Gas Burners, and Consumers' Meters, &c.
5. Tubing, plain and ornamental.
6. Metallic Bolsteads, Brass and Iron.
7. Chandeliers, Lamps, and Candelabra, for Oil, Candles, or Camphire, and Lamp Chains.
8. Railway and Carriage Brass Foundry, and Signal Lamps and Lanterns.
9. Bronze Figures, Busts, and Chimney Ornaments.
10. Bells, House, Church, Ship, Table, &c., and Alarums.
11. Candlesticks, Table and Bedroom.
12. Monumental Brasces and Ecclesiastical Brass-work.
13. Copper and Steel Plate for Engravers.
14. Miscellaneous.

B. COPPER, ZINC, TIN, PEWTER, AND GENERAL BRAZIERY.

1. Kettles, Casseroles, Copper, Saucepans, Steamers, Plate-warmers, &c.
2. Bronzed Tea and Coffee Urns, Kettles, &c.
3. Tubing, Copper, Tin, Lead, &c.
4. Pewter, German Silver, and Britannia-metal Teapots, Basing, Dishes, Spoons, Ladies' Inkstands, &c.
5. Copper Furniture Plates, Escutcheons, &c.
6. Zinc Articles generally.

C. IRON MANUFACTURE. (See also Land V.)

1. Stoves, Grates, Fenders and Fire Irons, Kitchen Ranges, Cooking Apparatus, Smoke-jacks.
2. Warming Apparatus for Halls and Rooms, Ships, &c., either by Water, Coal, Coke, Wood, Charcoal, or Gas.
3. Shower, Vapour, Air, and Warm-water Baths.
4. Ventilators, Metallic and others.
5. Pipes and Gutters, &c.
6. Locks and Hinges.
7. General Ironmongery.
8. Ice Machines.
9. Knife-cleaning Machines.
10. Letter-copying Machines and Presses.
11. Saddlers' Ironmongery.
12. Hollow Ware, cast and wrought, tinned and enamelled.
13. Spades, Shovels, Pickaxes, Hoes, Rakes, Garden-rollers, &c. (See also S. IX.)
14. Nails, cut, cast, and wrought, in Iron, Copper, and other Metals.
15. Screws and Railway Bolts, &c.
16. Iron Safes, Cash-boxes, fire-proof and otherwise.
17. Horse-shoes.
18. Gates, Railings, Hursties, and Stable Fittings.
19. Mangles, Washing Machines, &c.

D. STEEL MANUFACTURE.

1. Tools and heavy Steel Toys, Hammer, Vices, &c.
2. Steel Ornaments, and light fancy Steel Toys, Brooches, Buckles, &c.
3. Steel Pens and Metallic Pens.
4. Needles, Fish-hooks, and Fishing Tackle.

E. BURRO, &c.

1. Buttons, Metallic, Florentine, Pearl, Bone, &c.
2. Metal Boxes, Watch Boxes, &c.

F. WIRE WORK, &c.

1. Wire Gauge, for Window Frame, Fencing, Poultry, Birdcages, &c.
2. Wire, Iron, Brass, Steel, and Copper.
3. Pins, white and black.
4. Hooks and Eyes.
5. Metallic Wire Baskets.
6. Wire Rope.

XXIII. Working in Precious Metals and in their imitations: Jewellery, and all articles of Virtue and Luxury not included in the other Classes.

A. COMMISSION SERVICES.

As Altar-dishes, Flagons, Chalices, Patens, Plates, &c.

B. ARTICLES OF GOLD AND SILVER PLATE, FOR DECORATIVE PURPOSES AND PRESENTATION PIECES.

1. Racing Prizes, Testimonials, Allegorical, historical, and emblematic Groups and Compositions, Shields, Centre Pieces, Vases, Tazzas, Ewers, Salvers, Candelabra, &c.
2. The same Articles made in hammered or repoussé metal.

C. SMALLER ARTICLES FOR MORE GENERAL DOMESTIC USE.

1. For the Dinner Table; as smaller Candelabra with branches, Candlesticks, Centre Pieces, Soup and Sauce Tureens, Covered Dishes, smaller Mounted Dishes, Flat Dishes, Flower-stands and Epergnes, Dessert Services, Table and Dessert Knives, Spoons and Forks, Salvers, Bread and Cake Baskets, Claret Jugs, Wine Coolers, Cruet Frames, Mustard Pots, Salts, &c.
2. Breakfast and Tea-table Service; as Tea and Coffee Urns and Kettles, Tea and Coffee Pots and Stands, Sugar Basins, Milk and Cream Jugs, Ewers and Basins, Toast Racks, &c.
3. Dressing and Library Table and Travelling Utensils; as Inkstands and Writing Appendages, Dressing Cases and Instruments, &c.
4. Miscellaneous; as Watch and Clock Cases, Toys, Pencil Cases, Seals and Keys, Filigree Baskets and Ornaments.

D. ELECTRO-PLATED GOODS OF ALL DESCRIPTIONS, COMPREHENDING ALL THAT CAN BE EXECUTED IN SILVER AND OTHER METALS.

E. SHEETED AND OTHER PLATED GOODS.

- Centre and Side covered Dishes and Warmers, Soup Tureens, Cruet Frames, Liqueur Frames, Pickle ditto, Candlesticks and Branches, Candelabra, Bread and Cake Baskets, Toasters and Trays, Tea and Coffee Services, Tea-trays, Hand Waxes, Claret Jugs, Decanter Stands, Sugar Stands, Flower Stands, Nut Crackers, Grape Scissors, Mustard Pots, &c.

F. GILT AND OR-MOLD WORK.

1. Gilt by the Electro process.
2. Gilt by amalgamation, or "Water Gilding"
3. Imitation Jewellery and Toys.

G. JEWELLERY.

1. Works exhibiting the Precious Stones and Pearls, as Diamonds, Rubies, Sapphires, Emeralds, Opals, Turquoise, and the manner of setting them in Crowns, Coronets, Stars, Orbits, Tiaras, Head Ornaments, Bouquets, Necklaces, Bracelets, and Armlets, Presentation Snuff-boxes, Brooches, Ear Pendants, Medallions, Studs, and Buttons.

3. Ornaments made of Gold, whether plain or enamelled, as Bracelets, Brooches, Necklaces, Earrings, Pins, Waist-Buckles, Chains, Buckles, Studs, Chatelaines, &c. &c. &c.
4. Jewellery by imitations of Precious and other Stones.
5. Ornaments worked in Ivory, Jet, Horn, Hair, and other materials, of which the Precious Stones or Metals do not form the principal feature.

H. ORNAMENTS AND TOYS WORKED IN IRON, STEEL, AND OTHER METALS, WHICH ARE NEITHER PRECIOUS METALS NOR IMITATIONS OF THEM, AS CHATELAINES OF STEEL, CHAINS OF STEEL, SCORD-HILTS, CUT-STEEL, SHOE AND KNEE BUCKLES, BERLIN IRON ORNAMENTS, CHAINS, NECKLACES, BRACELETS, ETC.

I. ENAMELLING AND DAMASCENE WORK.

1. Enamelling of subjects on Gold and Precious Metals. (Except when shown in the Section of FINE ARTS.)
2. Damascene Work, or insertion of one Metal in another, not included in the above-named Classes, as forming a mingled ingredient in some more important species of Manufactures.

J. ARTICLES OF USE OR CURIOSITY NOT INCLUDED IN THE PREVIOUS ENUMERATION.

## XXIV.—Glass.

## A. WINDOW GLASS, INCLUDING SHEET GLASS, CROWN GLASS, AND COLOURED SHEET GLASS.

1. Crown.
2. Sheet.
3. Brown Plate Glass, silvered and unsilvered.
4. Coloured Sheet, Pot Metal, or flashed.
5. Glass Ventilators.
6. Glass Shades, round, oval, and square.

## B. PAINTED AND OTHER KINDS OF ORNAMENTED WINDOW GLASS.

1. Enamelled, Embossed, Etched, painted white, or coloured Window Glass.
2. Painted and Lensed Windows.

## C. CAST PLATE GLASS.

1. Rough Plate.
2. Ground and polished, silvered and unsilvered.
3. Pressed Plate.
4. Rolled Plate, white and coloured.

## D. BOTTLE GLASS.

1. Ordinary Bottle-glass, including Moulded Bottles.
2. Medicinal Bottle-glass, including Phials, &c., blown and moulded, of all kinds and shapes.
3. White Bottle-glass, Crown, Pressed, and Moulded Bottles.
4. Water-pipes and Tubing.

## E. GLASS FOR CHEMICAL AND PHILOSOPHICAL APPARATUS.

1. Glass for Murras, Retorts, and other kinds of Chemical and Philosophical Apparatus.
2. Water-pipes and Tubing.

## F. FLINT GLASS OR CRYSTAL, WITH OR WITHOUT LEAD, WHITE, COLOURED, AND ORNAMENTED FOR TABLE VASES, &amp;c.

1. Blown.
2. Moulded and Pressed.
3. Cut and Engraved.
4. Reticulated and spun with a variety of colours, incrustated, flashed, enamelled of all colours, opalescent, imitation of Alabaster, gilt, platinised, silvered, &c.
5. Glass Mosaic, Millefiori, Aventurinæ, and Venetian Glass Weights, &c.
6. Beads, Imitation Pearls, &c.
7. Chandeliers, Candlesticks, and all Glass Apparatus for Lamps, Candlesticks, Girandoles, Wall Brackets, with or without drops, &c.

## G. OPTICAL GLASS, FLINT AND CROWN.

1. Rough Discs of Flint and Crown, to make Lenses for Telescopes, Microscopes, Magnifying and Calotype Apparatus, &c.
2. Flint and Crown, blown or cast in plates for the Optician.
3. Thin Glass for Microscopes.
4. Refractive Apparatus, Prismatic Lenses for Light-houses. (See also Class J.)

## XXV. Ceramic Manufactures—Porcelain, Earthenware, &amp;c.

## A. PORCELAIN, HARD.

1. Chinese.
2. Japanese.
3. Continental, as Berlin, Meissen, &c.

## B. STATUARY PORCELAIN.

1. Statuary.
2. Parian.
3. Carrara.

## C. TENDER PORCELAIN.

1. English Porcelain, soft or tender.
2. French, with Silicious body.

## D. STONEWARE, GLAZED AND UNGLAZED.

1. Ironstone, or Stone China, glazed.
2. White Stone body, unglazed.
3. Coloured body, Jasper.
4. " " Egyptian black, unglazed.
5. " " Red.
6. " " Cane.
7. " " Drab.
8. Brownware, with salt glaze. (The Lambeth, Chertfield, and Beauvais manufactures are included in this class.)
9. Chemical utensils. (These are made both in Stoneware and Hard Porcelain.)

## E. EARTHENWARE.

1. White body for Printing, Painting, or Enamelling in different Colours.
2. Common Cream-colour.
3. Green glazed ware.
4. Rockingham.
5. Delft ware.
6. Majolica ware.
7. Mocha and Dipped Ware.
8. Common Lead-glazed ditto, for utensils.
9. Coloured body, Turquoise.
10. " " Drab.
11. " " Olive.
12. " " Buff.
13. " " Cottage brown.

## F. TERRA COTTA.

1. Vases and Garden-pots.
2. Ornaments for Architecture.
3. Eucastic or Inlaid Tiles.
4. Tesserae of various colours, compressed from powdered clay.
5. Superior Plain Tiles for pavements, ditto ditto.
6. " " Bricks, ditto ditto.
7. " " Roofing Tiles, ditto ditto.
8. Chimney Pipes.
9. Common Bricks.
10. " " Roofing Tiles, &c.

## G. ORNAMENTED OR DECORATED.

1. Ornamented on Biscuit—  
Painted by hand.  
Printed and transferred in various colours.
2. Ornamented on the glaze.  
Painted by hand.  
Printed by the press.  
Printed by hand.  
Gold Lustre.  
Silver.  
Steel.  
Enamelling in various colours.  
Gilding.

## H. PRODUCTIONS FOR ARCHITECTURAL PURPOSES.

## XXVI. Decorative Furniture and Upholstery, including Paper-hangings, Papier-maché, and Japanned Goods.

## A. DECORATION GENERALLY, INCLUDING ECCLESIASTICAL DECORATION.

1. Ecclesiastical Decoration generally.
2. Ornamental coloured Decorations executed by hand.
3. Imitations of Woods, Marbles, &c., ditto.
4. Relievo Decoration, mechanically produced.

## B. FURNITURE AND UPHOLSTERY.

1. Cabinet Work, plain.
2. Cabinet Work, carved or ornamental.
3. Marqueterie, inlaid Work, in Woods, &c.
4. Buhl or Metallic inlaid Work.
5. Chairs, Sofas, and Beds, and generally Upholstery.

## C. PAPER-HANGINGS.

1. Damask Patterns.
2. Flower Patterns.
3. Flock and Metal Papers.
4. Decorative Paper-hangings by Block-work.
5. " " by any other process.
6. Machine-printed Paper-hangings.

## D. PAPIER-MACHÉ, JAPANNED GOODS, PEARL AND TORTOISE-SHELL WORK.

1. Papier-maché, japanned, inlaid, and decorated.
2. Papier-maché (not japanned), produced in ornamental forms for decoration.
3. Japanned Goods in Iron, &c.
4. Pearl and Tortoise-shell Work.

## XXVII. Manufactures in Mineral Substances used for Building or Decoration, as in Marble, Slate, Porphyries, Cement, Artificial Stones, &amp;c.

## A. MANUFACTURES IN COMMON STONES.

1. For Building, and constructions not strictly decorative.
2. For Decorative purposes.

## B. MANUFACTURES IN SLATE.

1. For Construction.
2. For Decoration.

## C. MANUFACTURES IN CEMENT AND ARTIFICIAL STONE.

**D. MANUFACTURES IN MARBLES, GRANITES, PORPHYRIES, ALABASTER, STONE, ETC., FOR USEFUL OR ORNAMENTAL PURPOSES.**

1. For Construction and external Decoration.
2. For internal Decoration (not Furniture), as Chimney-pieces, &c.
3. For articles of Furniture, as Tables, &c.
4. For purposes of mere Ornament.

**E. INLAID WORK IN STONE, MARBLE, AND OTHER MINERAL SUBSTANCES.**

**F. ORNAMENTAL WORK IN PLASTER, COMPOSITION, SCAGLIOLA, IMITATION MARBLE, &c.**

**G. COMBINATIONS OF IRON AND OTHER METALS WITH GLASS AND OTHER SUBSTANCES FOR VARIOUS USEFUL PURPOSES.**

1. For Architectural purposes.
2. For Miscellaneous purposes.

**XXVIII. Manufactures from Animal and Vegetable Substances, not being Woven, Felted, or included in other Sections.**

**A. MANUFACTURES FROM CAOUTCHOUC.**

1. Impermeable Articles.

- Boots.
- Holdsword's Life Preservers.
- Captain Smith's Life Preservers.
- Hydrostatic and Air Beds.
- Water and Air Cushions.
- Gas Bags.
- Printers' Blankets.
- Coats, Capes, Coats, Paletots, &c.
- Boots and Shoes, Over Shoes or Gaiters.
- Fishing and Deck Boots.
- Ship Sheets.
- Bellows.
- Air-pump Valves for Steam Engines.
- Sponge Baths and Bags.
- Prepared Water and Air proof Textures of every description.

2. Elastic Articles.

- Railway and other Carriage Springs and Buffers.
- Valve Canvas.
- Knee Caps.
- Surgical Bottles.
- Pump Buckets and Valves.
- Bands and Rings for Letters and Packages.
- Writing Tablets.
- Trouser Straps.
- Gussets for Boots.
- Vest Backs.
- Washers for Flange and Socket Joints.
- Driving Bands for Machinery.
- Railway Felt.
- Wheel Tires.
- E. Smith's Torsion Springs for Window-blinds and Shades.
- Door Springs.
- Dr. Bell's Sewer and Sink Valves.
- Hodge's Projectile and Lifting Straps.
- Air-pump Valves.
- Elastic Webbing.
- Cricketer Gloves and Balls.
- Stoppers for Decanters, Bottles, Jars, and other vessels.

3. Articles in Caoutchouc—Moulded, Embossed, Coloured, and Printed.

- Bas-reliefs.
- Flags.
- Maps, printed on Caoutchouc.
- Shirts, in Colour.
- Embossed and Printed Ornaments.
- Garters, Bracelets, &c., Embossed, Coloured, or Printed.
- Bottles, Embossed and in Colours.
- Embossed Skins for Seats and other Purposes.
- Vulcanized Articles combined with Metals, such as Decanter Stoppers, Inlets, Cocks and Taps for Fluids, Hinges, Locks and Bolts, Wheel Tires, Plugs for Cisterns, Linings of Vessels, &c.

**B. MANUFACTURES FROM GUTTA PERCHA.**

1. For Waterproofing purposes.
2. For Agricultural uses, as Tubing for Manure, &c.
3. For Maritime purposes, as Speaking Trumpets, Life Boats, Life Boats, Cones, Filler Pipes, &c.

4. Decorative Uses, as Ornamental Mouldings, Brackets, Medallions, Picture Frames, &c.

5. Surgical, Electrical, and Chemical Uses, as Dissolved Gutta Percha for Wounds, Stethoscopes, Splints, Ear Trumpets, &c., Carboys, Funnels, Acid Vessels, Covering of Telegraph Wire, Insulating Stools, &c.
6. Domestic and Miscellaneous Uses, as Soles for Shoes, Linings of Cisterns, Conveyance of Water and Gas, Heating Apparatus, &c.

**C. MANUFACTURES FROM IVORY, TORTOISESHELL, SHELLS, BONE, HORN, BRISTLES, AND VEGETABLE IVORY.**

**D. GENERAL MANUFACTURES FROM WOOD (not being Furniture).**

1. Turnery.
2. Carving, &c.
3. Coopers' Work of all kinds.
4. Basket and Wicker work.
5. Miscellaneous Wood work.

**E. MANUFACTURES FROM STRAW, GRASS, AND OTHER SIMILAR MATERIALS.**

**F. MISCELLANEOUS MANUFACTURES FROM ANIMAL AND VEGETABLE SUBSTANCES.**

**XXIX. Miscellaneous Manufactures and Small Wares.**

**A. PERFUMERY AND SOAP.**

**B. ARTICLES FOR PERSONAL USE, AS WRITING DESKS, DRESSING CASES, WORKBOXES, WHEN NOT EXHIBITED IN CONNECTION WITH PRECIOUS METALS (XXXIII.), AND TRAVELLING GEAR GENERALLY.**

**C. ARTIFICIAL FLOWERS.**

**D. CANDLES, AND OTHER MEANS OF GIVING LIGHT.**

**E. CONNECTIONS OF ALL KINDS.**

**F. BEADS AND TOYS, WHEN NOT OF HARDWARE, FANS, ETC.**

**G. UMBRELLAS, PARASOLS, WALKING-STICKS, ETC.**

**H. FISHING TACKLE OF ALL KINDS, ARCHERY.**

**I. GAMES OF ALL KINDS.**

**J. TAXIDERMY.**

**K. OTHER MISCELLANEOUS MANUFACTURES.**

**FINE ARTS.**

(So far as they come within the limitations of the Exhibition.)

**XX. Sculpture, Models, and Plastic Art.**

**A. SCULPTURE AS A FINE ART.**

1. In Metals simple, as Gold, Silver, Copper, Iron, Zinc, Lead, &c.
2. In Metals compound, as Bronze, Electrotype, &c.
3. In Minerals simple, as Marble, Stones, Gems, Clay, &c.
4. In elaborate Mineral Materials, as Glass, Porcelain, &c.
5. In Woods and other Vegetable Substances.
6. In Animal Substances, as Ivory, Bone, Shells, Shell Cameos.

**B. WORKS IN DIE-SINKING, INTAGLIO.**

1. Coins, Medals, and Models of a Medallion character in any material.
2. Impressions struck from Dies for ornamental purposes.
3. Gems, either in Cameo or in Intaglio, Shell Cameos.
4. Seals, &c.

**C. ARCHITECTURAL DECORATIONS.**

1. Integral, in Relief, Colour, &c.
2. Adventitious, as Stained Glass, Tapestry, &c.

**D. MOSAICS AND INLAID WORKS.**

1. In Stone.
2. In Tiles.
3. In Vitrified Materials.
4. In Wood.
5. In Metal.

**E. PAINTELS.**

1. On Metals.
2. On China.
3. On Glass.

**F. MATERIALS AND PROCESSES APPLICABLE TO THE FINE ARTS GENERALLY, INCLUDING FINE ART PRINTING, PRINTING IN COLOUR, ETC. ETC.**

1. Encaustic Painting and Fresco.
2. Ornamental Printing, Chromo-typography, Gold-Illuminated Typography, Typography combined or uncombined with Embossing.
3. Lithography, Black, Chromo-lithography, Gold-Illuminated Lithography, Lithography combined or uncombined with Embossing.
4. Zincography, or other modes of Printing.

**G. MODELS.**

1. In Architecture.
2. Topography.
3. Anatomy.

## APPENDIX B.

## INSTRUCTIONS FROM THE COUNCIL OF CHAIRMEN TO THE JURIES.

1. In accordance with the decisions of the Royal Commissioners, the Council of Chairmen have met and agreed to the following Instructions as a guide to the Juries.

2. *Working of Juries.*—In regard to the working of the Juries, the Council of Chairmen think it advisable to leave much to the discretion and gradual experience of each Jury; but upon the following points the decisions of the Royal Commissioners are precise, and it will be desirable that the practice of the Juries should be uniform.

3. The Juries will, at their first meeting on Monday, consider the course to be followed in the examination of the subjects confided to them, and arrange generally the time and places for their respective meetings.

4. *Deputy-Chairmen.*—The first duty of each Jury will be to elect a Deputy-Chairman, who will assist the Chairman, and fill his place in the Jury, or at the Council, in his absence.

5. *Reporters.*—A Member of the Jury will be appointed to draw up a Report upon the class of subjects submitted to it. It will be advisable that this appointment should be made as soon as the eligibility and willingness of some Member to undertake that duty can be ascertained. As the Reports will probably be published, they should be drawn up with care necessary to describe the State of Industry of all Nations, as shown in this Exhibition, and in such a manner as may best form a permanent record of the Exhibition itself.

6. *Sub-Committees.*—The Royal Commissioners have given their sanction to Juries acting in matters of detail by Sub-Committees. How far it may be convenient in each case to adopt this system, and to depute to a Sub-Committee, or to individual Members, the investigation of particular objects, is left to the judgment of each Jury; but it must be borne in mind that no Award can be made but by a majority of the Jury.

7. *Witnesses and Associates.*—When a Jury may wish to call in the aid of persons of technical knowledge to aid their judgment, they may do so in conformity with the 20th Article of the General Decisions.

8. Jurors of another Class, when knowledge of that Class is required to guide the Jury, may be called in if a majority of the Jury should decide to do so.

9. In both the above cases, however, the persons to be consulted do not possess Notes, and only remain associated with the Jury as long as the special occasion for which they were called requires their presence.

10. *Juries to carry on their investigations without delay.*—The Juries are expected to carry on their investigation with as little intermission, and to come to their decision with as little delay as possible.

11. *Modes of making Awards.*—When a Jury has decided upon its Awards, those Awards will be submitted to a Meeting of all the Juries of the same group for confirmation, and for the investigation of any Decision that may be disputed.

12. The Awards will then be submitted to the Council of Chairmen, to secure uniformity of action, and a compliance with the Rules now laid down, or which may hereafter be sanctioned by the Council.

13. The Awards will become final as soon as the Council of Chairmen shall have reported that they are in conformity to those Rules.

14. *Secrecy.*—All the Considerations, Discussions, and Decisions of each Jury and of the Council of Chairmen, are to be considered as strictly confidential, and on no account to be divulged until the Award has become final.

15. *Medals to be awarded without reference to Nationality.*—The Medals will be awarded for excellence only, without reference to countries, the Exhibition being considered as a whole, and not as consisting of the produce of different nations.

16. *Individual competition to be avoided.*—In making the Awards, the Juries will bear in mind that the Royal Commissioners desire that the different Medals should indicate

different kinds of merit, and not degenerate in the same kind of merit.

17. *Two Medals only to be awarded.*—The Juries will only have to award the medium size and large Medal. The small Medal will not be given by the Juries, the Commission having withdrawn it as a Prize Medal at the request of the Council of Chairmen.

18. *Conditions for the award of the Medals.*—The medium size (or as it is proposed to be called the "Prize Medal") will be awarded by the Juries in conformity with the decisions laid down in the paper issued by the Royal Commissioners, with the general indications contained in these directions.

19. The Great Medal can be finally awarded only by the Council of Chairmen, upon recommendations made to that body by the allied Juries referred to in Decision 9.

20. Each Jury must obtain the sanction of its own group of Juries to its recommendation of the Great Medal, before the Council of Chairmen can take the award into consideration. The grounds on which this recommendation is made must be fully stated. The Great Medal will only be given for very pre-eminent and indisputable merit. It is impossible, until the Juries have acquired a knowledge of the articles exhibited, to define the proportion of the Great to the Prize Medal; but the Council of Chairmen have to announce their intention of making the proportion a very small one.

21. The Chairmen of the groups of Prizes have had under their consideration the various conditions which it will be advisable to adopt in the award of Prizes in the various classes into which the Exhibition is divided. They do not intend that these conditions should be compulsory on the Juries, as it is probable that they may require modification in particular cases, but they may be useful as indications to show the general grounds on which awards may be made.

## GROUP A.

Medals are to be awarded for novelty in the mode of obtaining, applying, and adapting Raw Materials and Produce, skill and excellence in known modes of obtaining, applying, or adapting them; comparative excellence in the quality obtained, combined with utility. The value of the instructiveness of any Series exhibited.

## GROUP B.

The Sub-Committee of the Chairmen of this Group, for certain reasons set forth in their Report (see Report), strongly urge that if novelty of invention (as far as regards Machinery) be not altogether excluded, the greatest caution should be used, and the most jealous scrutiny employed by Jurors before any Prize whatever be awarded under such claims for merit.

## CLASS V.—Machines for Direct Use.

Fitness of the work for the object sought to be obtained (which combines almost every merit of Machinery), economy in first cost, durability, economy of maintenance, excellence of workmanship.

## CLASS VA.—Carriages.

Successful application of any new Material, with elegance of design and excellence of workmanship, strength and lightness, reasonable cheapness.

Note.—These qualities will apply almost exclusively to Carriages of luxury.

## For the Public Service.

Lightness, sufficient solidity for safety, durability, cheapness.

## CLASS VI.—Manufacturing Machines and Tools.

Fitness of the Machinery for the objects sought, economy in the first cost, durability, and excellence of workmanship; economy in production, and perfection in articles manufactured; saving in time, and quantity produced; economy of maintenance.

**CLASS VII.—Civil Engineering, Architectural and Building Contrivances.**

Science and skill in Design, to obtain the object sought with the greatest economy; fitness in the application of Materials, success in the work in which the Model or Drawing is exhibited; perfection of workmanship in the Model or Drawing exhibited.

**CLASS VIII.—Naval Architecture and Military Engineering; Ordnance, Armour, and Accoutrements.**

Merits of combination in the Models or Drawings relating to Military or Naval Engineering; advantages obtained by experiments in carrying out the means proposed either by Models or Drawings. Improvements in Arms, Apparatus, or any articles belonging to Military and Naval Service or Architecture, to Rigging or other branches of Seamanship, to Accoutrements or Equipments of Troops, their fitness and efficacy; economy in production.

**CLASS IX.**

In this Class actual trial has been found generally necessary for the safe award of Prizes; Field Instruments being tried on the land, and Yard Implements being also set to work, and the results exhibited in Numerical Tables.

**CLASS X.—Philosophical Instruments.**

Novelty of inventions, or novelty in the whole or part of the instruments; ingenuity of construction; new application of old principles; application of new principles; improved beauty of form; increased durability, and more extensive application.

**CLASS XI.—Musical Instruments.**

Novelty of invention, novel application of old inventions, improvement of mechanical action. Tone, perfection of workmanship, beauty of design combined with general excellence, increased felicity of action, cheapness combined with durability.

**CLASS XII.—Horary.**

Ascertained or probable accuracy and certainty of performance, whether time-keeping, discharging of striking parts, or registering; stability, strength and durability, simplicity and economy of construction, goodness of execution. High finish to be considered subordinate to the scientific objects.

**CLASS XIII.—Surgical Instruments.**

For instruments which possess novelty of a useful character, and giving evidence of originality and inventive power, ingenuity in the application, extension, or modification of principles already known, or for new combinations, mechanical skill, including cheapness, finish, and other qualities of mechanical execution.

**GROUP C.—Manufactures. Textile Fabrics.**

In this, those articles will be rewarded which fulfil in the highest degree the conditions specified in the sectional list, namely, increased usefulness, such as permanency in dyes, improved forms and arrangements in articles of utility, &c.; superior quality, or superior skill in workmanship; new use of known materials; use of new materials; new combinations of materials; beauty of design in form or colour, or both, with reference to utility; cheapness relatively to excellence of production.

**GROUP D.—Metallic, Vitreous, and Ceramic Manufacture.**

Important inventions and discoveries, or regularity combined with excellence of design; novel application of known discoveries; great utility combined with economy and beauty; excellence of workmanship and quality.

**GROUP E.—Miscellaneous.**

Novelty of material in application, excellency of design, material, workmanship, and cheapness.

**GROUP F.—Fine Arts.**

Originality and excellence of design and importance of the work, combined with great merit in execution; merit in execution, combined with application to useful purposes.

APPENDIX C.

MINUTE OF ROYAL COMMISSION ON THE AWARD OF THE COUNCIL MEDAL.

With reference to the awards of the Council Medal, the Commissioners think it proper to recapitulate the terms of those Decisions, and to explain with somewhat greater minuteness the exact meaning which they intended to attach to them.

"The 107th of the published Decisions of the Commission is as follows:—

"It is the intention of the Commissioners to reward excellence in whatever form it is presented, and not to give inducements to the distinctions of a merely individual competition. Although the Commissioners have determined on having three Medals of different sizes, and designs, they do not propose to instruct the Juries to award them as first, second, and third in degree for the same class of subjects. They do not wish to trammel the Juries by any precise limitation; but they consider that the Juries will rather view the three kinds of Medals as a means of appreciating and distinguishing the respective characters of the subjects to be rewarded, and not of making distinctive marks in the same Class of Articles exhibited."

"And the 21st Article of the Decisions regarding Juries is this:—

"The three classes of Medals are intended to distinguish the respective characters of subjects, and not as first, second, and third in degree for the same class of subjects."

"The important features in these Decisions, and that which distinguishes the mode of granting Medals on the present occasion from that usually adopted in the Exhibitions of Foreign Countries, is the announcement that the Medals are not to be awarded, as first, second, or third in degree for the same class of subjects. It is obvious, therefore, that in the case of manufactured Articles mere excellence of manufacture, being in other words a mere difference in degree between subjects included in the same class, cannot be rewarded with a Council Medal without a deviation from the principle of this decision. If, however, there is

any novelty of invention or adaptation, or any peculiarity in the mode of manufacture, which can also be taken into account, and of which the importance and value shall be judged sufficient, the Council Medal may properly be given.

"Thus, for example, if a piece of Linen be exhibited of such remarkable excellence as to be at once and by unanimous consent recognised as greatly superior to any other piece of Linen in the whole Exhibition, yet if the ordinary processes only have been employed in its production, and if it be not distinguished by any originality in the design applied to it, it ought not to have a Council Medal, however great may have been the care and labour bestowed upon it. But if, on the other hand, a piece of linen of very decided excellence should be produced by a new method, exhibiting advantages not hitherto attained, it would be quite within the spirit of the Decision, in question that such method should be rewarded with a Council Medal.

"Of again, if a sample of Sugar of extraordinary fineness should be exhibited, if such fineness were the result only of the application of the ordinary processes, with more than ordinary care and skill, it ought not to have the Council Medal; but if a new chemical agent, or a new process had been employed with advantage in its production, the process by which it was produced, if sufficiently important, would be eligible to receive it.

"It is not, however, intended to limit the granting of the Council Medal to cases of production by a new process: such a rule would, of course, not apply where the question of Fine Art was involved. In judging of works of pure art, the Medal will of course be given to those cases where the most remarkable and pre-eminent genius has been displayed; and in cases where design is applied to an article of Manufacture, it may sometimes happen that it will be of sufficient originality and importance to justify the grant of a Council Medal as an acknowledgment of the taste displayed.

"Thus, for instance, a piece of Porcelain or a piece of Tapestry, though they could not receive the Council Medal

for the mere excellence of the workmanship, might properly receive it for a very extraordinary and original merit of the design applied to them. And, in like manner, though a Council Medal ought not to be given to a piece of Furniture, of which the principal merit was that it was well made, it might be awarded to it if these were so much beauty in the design as to entitle it to great distinction as a Work of Art.

"The Commissioners must, however, limit themselves by observing that they would not recognise beauty of design as a sufficient title to a Council Medal unless applied to an object of some importance. Very great merit might be found in the carving of an umbrella or a pipe, yet it might be thought improper to reward such merit with a Council Medal, on account of the comparative insignificance of the subject.

"The last observation naturally leads the Commissioners to offer some remarks upon another point on which it is possible that doubts may arise; namely, whether the fact of an Exhibitor having incurred great expense in the preparation of an Article for exhibition should entitle him to a Council Medal: as, for instance, in the case of the Exhibitors of valuable *luxury* products, of specimens of Manufactured Goods remarkable only for the size of the specimens, of very precious Jewels, or of collections of the productions of particular districts. In these cases, the Commissioners are decidedly of opinion that the mere fact of a large outlay of money ought not to be regarded as entitling an Exhibitor to receive a Council Medal, though care should, of course, be taken, that his zealous co-operation in promoting the objects of the Exhibition, be properly noticed in the Report of the Jury of his Class.

"In the foregoing remarks, the Commissioners have repeatedly spoken of rewarding inventions and new processes. They think it right, therefore, to guard themselves against being supposed to throw upon the Juries the duty of discovering whether each particular object which they mark for reward is actually the invention of the party

claiming the merit of it. They can conceive that, in many cases, such an investigation would, under the circumstances, be impossible. In Machinery, particularly, they presume that the Juries will reward an important Machine without undertaking to pronounce whether the novelties exhibited in its construction have been originated by the Exhibitor, or have been borrowed or adapted by him from some one else. The test of invention will be satisfied if the Machine be rewarded for its importance and ingenuity, and not for the mere excellence of workmanship.

"As the Commissioners have referred to the claims of invention, it would appear to be desirable to fix some date beyond which invention should cease to be a claim for the Council Medal. It has not been made a condition in the admission of Articles to the Exhibition that they should be new; but it would be obviously difficult and inexpedient to discuss claims of invention made many years since. It appears to the Commissioners that, as most European States consider from fourteen to fifteen years a proper period for limiting by patents the use of an invention to the discoverer before it becomes the property of the public, this period would form a limit, beyond which the claims of invention should not be admitted.

"In communicating these remarks to the Council of Chairmen, the Royal Commissioners must again repeat that they are only anxious to obviate the danger of their published Decisions being misunderstood. The responsibility of giving effect to those Decisions must rest with the Council of Chairmen, in whom the control of the separate Juries, and more particularly the duty of regulating the distribution of the Council Medal, has been specially vested; and the Royal Commissioners would strongly impress upon them the responsibility under which they lie of exercising that control with care and firmness, according to the opinions which they may personally entertain of the merits of the several cases brought before them."

## APPENDIX D.

### DEPARTMENT OF JURIES.

DR. LYON PLAYFAIR, F.R.S., Special Commissioner in Charge of the Department of Juries.

#### DEPUTIES.

JOHN WILSON, F.R.S.E., late Principal of the Royal Agricultural College—*for Group A.—Raw Materials.*  
COL. J. A. LLOYD, F.R.S., Special Commissioner—*for Group B.—Machinery.*  
GEORGE WALLIS—*for Group C.—Textile Manufactures.*  
CAPTAIN BOSCAWEN IMMETSON, F.R.S.—*for Group D.—Metallic and Fibrous Manufactures.*  
SIR STAFFORD NORTHCOTE, Bart., Secretary to the Royal Commission—*for Groups E. & F.—Miscellaneous Manufactures and Fine Arts.*  
LIEUTENANT EDWARD WARD, R.E., Secretary to the Department of Juries.  
LIEUTENANT CROSSMAN, R.E., } Assistant Secretaries to Group B.  
LIEUTENANT DUCANT, R.E., }  
GEORGE WRIGHT, Assistant Secretary to Groups E. and F.  
MAJOR BOYD, Interpreter.

#### COUNCIL OF CHAIRMEN.

##### A.—Raw Materials.

- I. SIR HENRY DE LA BECHE, C.B., F.R.S.
- II. J. DUMAS.
- III. EDWARD DE LOPE.
- IV. PROFESSOR OWEN, F.R.S.

##### B.—Machinery.

- V. REV. F. MORELEY, M.A., F.R.S.
- VI. EARL JERSEY.
- VII. GEN. POMERET.
- VIII. I. K. BRUNEL, F.R.S.
- IX. BARON CHARLES DUPIN.
- X. PHILIP DUSEY, M.P., F.R.S.
- XI. SIR DAVID BREWSTER, F.R.S.
- XII. SIR HENRY BISHOP.
- XIII. E. B. DENISON, M.A.
- XIV. J. H. GREEN.

##### C.—Textile Fabrics.

- XV. SIR JAMES ANDERSON.
- XVI. PROFESSOR HERRMAN.
- XVII. G. T. KEMP.

##### XIV. COUNT VON HARRACH.

##### XV. HERR VON HOGAERTEN.

##### XVI. HON. COL. AUSTON.

##### XVII. M. M. VAN DE Weyer.

##### XVIII. HENRY TUCKER.

##### XIX. PROFESSOR BOLLEY, of Switzerland.

##### XX. WM. FELLIS.

##### D.—Metallic, Vitreous, and Ceramic Manufactures.

##### XXI. LORD WILKINSON.

##### XXII. HON. HORACE GREELEY.

##### XXIII. DUC DE LUTEN.

##### XXIV. LORD DE MAULEY.

##### XXV. DUKE OF ARGYLL.

##### E.—Miscellaneous Manufactures.

##### XXVI. PROFESSOR ROESNER.

##### XXVII. H. SIGNOR BENNETTO PISTRUCI.

##### XXVIII. SENOR DON JOAQUIN ALFONSO.

##### XXIX. VINCENZO CANNING.

##### F.—Fine Arts.

##### XXX. HERR VON VIELHAUS.

## LIST OF JURORS AND ASSOCIATE JURORS.

## I. MINING, QUARRYING, METALLURGICAL OPERATIONS, AND MINERAL PRODUCTS.

- SIR HENRY DE LA BECHE, C.B., F.R.S., *Chairman*, 28 Jermyn Street, Piccadilly; Director-General of the Geological Survey of the United Kingdom, &c.  
 A. DUFRENOY, *Deputy Chairman and Recorder*, France; Member of the Institute of France, Inspector-General of Mines, &c.  
 M. FARADAY, F.R.S., Royal Institution, Albemarle Street; Professor of Chemistry to the Royal Institution.  
 JULES HENRI GEMINAERT, Belgium; Engineer-in-Chief of the Corps of Miners.  
 W. E. LUGAN, F.R.S., 42 Sackville Street; Director of the Geological Survey of Canada.  
 FREDERICK SCHREIBER, Zollverein; Mining Engineer.  
 RICHARD TAYLOR, F.G.S. & F.R.S., Mineral Surveyor to the Duchy of Cornwall.  
 PROFESSOR PETER TURNER, Austria; President of Imperial Mining School, Leoben, Styria.

## ASSOCIATE.

Gabriel Kuznensky, \* Russia; Councillor of the Administration of Finances.

\* Juror in Class XXV.

## II. CHEMICAL AND PHARMACEUTICAL PROCESSES AND PRODUCTS GENERALLY.

- J. DUMAS, *Chairman*, France; former Minister of Agriculture and Commerce, Member of Institute, &c.  
 THOMAS GRAHAM, F.R.S., *Deputy Chairman and Reporter*, 4 Gordon Square; Professor of Chemistry, University College.  
 JACOB BELL, M.P., 15 Langham Place; Pharmacist.  
 MICHELE CALABANI, H.D., Sicily; Doctor of Medicine.  
 GEORGE GOSSWITZ, Austria; Chemical Manufacturer.  
 JOHN MERCER, F.R.S., Oakenshaw, near Accrington, Lancashire; Calico Printer.  
 H. J. PATTERSON, F.R.S., 10 Grey Street, Newcastle-on-Tyne; Chemical Manufacturer.  
 DR. VARRENTRAP, Zollverein; Professor of Chemistry

## ASSOCIATES.

- Thomas Anderson, M.D., F.R.S., Edinburgh; Chemist to the Highland and Agricultural Society of Scotland.  
 BALARD, France; Member of the Institute, &c. &c.  
 L. L. BONAPARTE, France; Member of the National Assembly.  
 William Linton, 7 Lodge Place, St. John's Wood; Artist.  
 A. PAYEN, France; Member of the Institute, Professor at the Conservatory of Arts and Sciences, Member of the Central Jury, &c.  
 Eugene Peligot, France; Professor at the Conservatory of Arts and Sciences, Member of the Central Jury.  
 John Percy, M.D., F.R.S., Museum of Practical Geology, London; Professor of Metallurgy.  
 J. PERSOZ, France; Professor of Chemistry at Petersburg, Member of the Central Jury, &c.

\* Juror in Class XXVIII.  
 † Juror in Class XXIV.

† Juror in Class IV.  
 § Juror in Class XVIII.

## III. SUBSTANCES USED AS FOOD.

- EDWARD DE LODGE, *Chairman*, Russia; Member of the Institute for the Administration of the Domains of the Empire.  
 Sir J. P. BOULEAU, Bart., F.R.S., *Deputy Chairman*, 20 Upper Brook Street.  
 JOSEPH D. HOOKER, M.D., R.N., F.R.S., *Reporter*, Royal Gardens, Kew; Botanist.  
 COMTE HERVE DE NARCOTAY, France; Secretary of the Central Jury, &c.  
 Dr. J. LINDL, F.R.S., 21 Regent Street; Professor of Botany, University College.  
 ASHLEY SMITH, United States; Planter.

No Associates in this Class.

## IV. VEGETABLE AND ANIMAL SUBSTANCES CHIEFLY USED IN MANUFACTURES, AS IMPLEMENTS, OR FOR ORNAMENT.

- PROFESSOR RICHARD OWEN, F.R.S., *Chairman and Joint Reporter*, College of Surgeons, Lincoln's Inn Fields; Curator to the College of Surgeons.  
 A. PAYEN, *Deputy Chairman*, France; Member of the Institute, Professor to the Museum of Arts and Sciences, Member of the Central Jury, &c.  
 PROFESSOR EDWARD SOLLY, *Joint Reporter*, F.R.S., 15 Tavistock Square; Lecturer on Chemistry at Addiscombe.  
 JUDGE E. S. DUNCAN, United States.  
 Dr. J. F. ROYLE, F.R.S., Heathfield Lodge, Acton; Professor of Materia Medica, King's College.  
 RAMON DE LA SAGRA, Spain; Corresponding Member of National Institute of France.  
 N. WALLICH, M.D., F.R.S., 5 Upper Gower Street, Bedford Square; formerly Curator of the Botanical Gardens, Calcutta.  
 F. WETHE, Zollverein; Councillor of Home Economy.

## ASSOCIATE.

George Peterson, \* Russia; Member of the Scientific Committee for the Administration of the Domains of the Empire.

\* Juror in Class XXVIII.

## V. MACHINES FOR DIRECT USE, INCLUDING CARRIAGES AND RAILWAY AND NAVAL MECHANISM.

- REV. HENRY MOSELEY, M.A., F.R.S., *Chairman and Reporter*, Wadsworth; Inspector of Schools, and formerly Professor of Mechanics at King's College.  
 COLONEL A. MORIN, *Deputy Chairman*, France; Member of Institute and of Central Jury, and Director of Museum of Arts and Sciences.  
 CHEF ALIER ADAM DE BURG, Austria; Director of Imperial Polytechnic Institute, Vice-President of Society of Arts and Manufactures, &c.  
 LUIGI CAFFARELLO, Austria; Mechanical Engineer.  
 PROFESSOR WILHELM ENGELTH, Austria.  
 W. FAIRBAIRN, Manchester; Mechanical Engineer.  
 JOHN FARREY, 67 Upper Guildford Street, Russell Square; Consulting Engineer.  
 JOHN HICK, Bolton-le-Moors; Mechanical Engineer.  
 H. MAUNSLAY, 4 Cheltenham Place, Lambeth; Mechanical Engineer.  
 ROBERT McCARTY, United States; Civil Engineer.  
 ROBERT NAPIER, Glasgow; Mechanical Engineer and Ship-builder.  
 CHARLES DE ROSSIUS-ORRAN, Belgium; Vice-President of the Chamber of Commerce of Liege.

## ASSOCIATES.

Professor Edward Cooper, King's College, Somerset House; Professor of Mechanics at King's College.  
 W. H. HUTCHER, 22 Hawley Road, Camden Town; Engineer.

## VI. SUB-JURY FOR CARRIAGES.

- THE EARL OF JERSEY, *Chairman*, 38 Berkeley Square.  
 J. HOLKAND, *Deputy Chairman and Reporter*, 254 Oxford Street; Coach Builder.  
 C. ARNOUX, France; Engineer.  
 T. HUTTON, Summer Hill, Dublin; Coach Builder.  
 O. McDANIEL, United States.  
 ANTOINE PONCELET, Belgium; Engineer-in-Chief.

No Associates in this Class.

## VII. MANUFACTURING MACHINES AND TOOLS.

- GENERAL J. V. PONCELET, *Chairman*, France; Member of Institute, late Director of Polytechnic School, &c.  
 REV. R. WILLIS, F.R.S., *Deputy Chairman and Reporter*, Cambridge; Jacksonian Professor of Natural and Experimental Philosophy at Cambridge.  
 LUIGI BRUGNATELLI, Vice-President of Chamber of Commerce, Milan; Member of the Scientific Institute of Bologna.  
 PROFESSOR FILIPPO CORRIADI, Tuscany; Director of the Technological Institute, Florence.  
 BENJAMIN FORTUGUILLI, Manchester; Mechanical Engineer.

CHARLES GASCOIGNE MACLEA, Leeds; Mechanical Engineer.  
 GUILHERME KOPKE, Portugal; Mechanical Engineer.  
 JOHN PENN, Greenwich; Mechanical Engineer.  
 GEORGE RENNIE, F.R.S., Whitehall Place, Mechanical Engineer.  
 T. R. SEWELL, Carrington, near Nottingham; Lace Manufacturer.  
 SAMUEL WEBBER, United States; Civil Engineer.  
 PROFESSOR W. WEDDING, Zollverein; Member of the Board of Trade and Commerce at Berlin.

## ASSOCIATES.

A. Barclay, Brewery, Park Street, Southwark; Brewer.  
 Robt. Dawson, 33 Mark Lane; Civil Engineer.  
 — Dolhouse, France.  
 J. Mercer, \* F.C.S., Oakenshaw, near Accrington, Lancashire; Calico Printer.  
 A. Payen, † France; Member of the Institute.  
 Dr. Varentrupp, ‡ Zollverein; Professor of Chemistry.  
 \* Juror in Class II. † Juror in Class IV. ‡ Juror in Class II.

## VII. CIVIL ENGINEERING, ARCHITECTURAL AND BUILDING CONTRIVANCES.

L. K. BRUNEL, F.R.S., *Chairman and Reporter*, Duke Street, Westminster; Civil Engineer.  
 CHARLES COMBES, *Deputy Chairman*, France; Member of Institute and of Central Jury.  
 DR. NEIL ARNOTT, F.R.S., Bedford Square; Doctor of Medicine.  
 F. W. CONRAD, Holland; Engineer, Chairman of Royal Institute of Engineers at Delft.  
 J. M. RENDEL, F.R.S., 8 Great George Street, Westminster; Civil Engineer.  
 COUNT A. E. DE ROSEN, Sweden and Norway; Swedish Royal Navy.  
 DR. J. V. C. SMITH, United States; Doctor of Medicine.  
 WILLIAM FITZ, F.R.S., 17 St. Helen's Place, Bishopsgate; Architect.

No Associates in this Class.

## VIII. NAVAL ARCHITECTURE AND MILITARY ENGINEERING, ORDNANCE, ARMOUR, AND ACCOUTREMENTS.

BARON CHARLES DUPRE, *Chairman and Reporter*, France; Member of Institute and President of Central Jury, &c.  
 MAJOR-GENERAL SIR JOHN BURGON, K.C.B., *Deputy Chairman*, 87 Pall Mall; Inspector General of Fortifications.  
 LIEUT.-COL. J. N. CORUGHON, Royal Arsenal, Woolwich.  
 CHARLES LESOINNE, Belgium; Member of the Chamber of Representatives, late Merchant.  
 MAJOR JEAN L. MICHELIS, France.  
 SIR BALDWIN WALKER, K.C.B., 66 Westbourne Terrace; Surveyor-General of the Navy.  
 A. WHITNEY, United States; Merchant.  
 ISAAC WATTS, Somerset House; Assistant Surveyor-General of the Navy.

## ASSOCIATES.

Capt. Beechey, R.N., Board of Trade.

# ANSWER OF HIS ROYAL HIGHNESS PRINCE ALBERT TO LORD CANNING'S REPORT.

MY LORD,

THE Royal Commissioners are much indebted to your Lordship, and to the distinguished gentlemen of this and other nations, who have acted on the Juries, intrusted with the award of the Prizes in the recent Exhibition, for the zeal with which they have undertaken, and the ability with which they have fulfilled, the task which has been allotted to them. The Commissioners are sensible that the services of these gentlemen have, in many instances, been rendered at great inconvenience to themselves, and at the sacrifice of very valuable time, and of important avocations. It is with pride and pleasure, that they have noticed in the lists of those who have performed this service to the Exhibition, the names of men of every nation of the most exalted rank, and of the most eminent reputations in statesmanship, in science, in literature, in manufactures, in commerce, and in the fine arts; of men in every respect well calculated not only to form a correct technical judgment upon the merits of the articles submitted to their inspection, but also to maintain the high character which the Commissioners have uniformly striven to impart to the Exhibition.

In no department of the vast undertaking, which has just been brought to a happy close, were greater difficulties to have been apprehended than in that in which your Lordship and your eminent Colleagues have given your assistance. On this, the first occasion on which the productions of the different nations of the globe have ever been brought together for the purpose of comparing their several merits, not only were prejudices and jealousies to have been expected to interfere with the decisions, but the nature of the case presented many difficulties of a formidable character, to the formation of a judgment which should appear satisfactory to all. The names of the Jurors, indeed, when once made known, were of themselves a sufficient guarantee for that impartiality which was essential to the fulfilment of their task; and from all that has come to the knowledge of the Royal Commissioners during the progress of their labours, they are fully satisfied that every award has been made with the most careful consideration, after the most ample and laborious investigation, and upon grounds most strictly honourable, just, and candid.

But although the high character of the Jurors would have fully justified the Commissioners in intrusting them with the award of the prizes without fettering their discretion with any instructions whatever, had nothing more than an impartial decision been required, there were difficulties of a very peculiar nature inherent to the task, which seemed to render necessary the adoption of some regulations that might, at first sight, appear to have been somewhat arbitrary in their character. The differences in the wants of various nations having necessarily impressed their several manufactures with different charac-

teristics, it would seem to be almost impossible for those who have been in the habit of judging the productions of their own country by one standard, to enter fully into merits which can only be properly appreciated by another standard, since the very points which in the one case appear to be excellencies, may in the other, not unnaturally, be taken as defects. This consideration and a knowledge of the evils which were to be apprehended from any accidentally erroneous decision, in a matter so intimately connected with the commercial interests of every nation, induced the Royal Commissioners to lay down, for the guidance of the Juries, those principles to which your Lordship has referred.

It would, perhaps, have been more interesting to the public had the Commissioners instructed the Juries to follow the practice which has usually prevailed in the Exhibitions of individual nations, and to grant Medals of different degrees, to mark the gradations of excellence among the Exhibitors; but they feel that they have adopted the safer course, and that which was upon the whole most in accordance with the feelings of the majority of the Exhibitors, in directing that no distinction should be made between their merits, if their productions came up to the standard requisite to entitle them to a Prize, but that all should, without exception, take the same rank and receive the same Medal.

The Commissioners, however, considered it right to place at the disposal of the Council of Chairmen a peculiar or "Council" Medal, in the cases to which your Lordship has referred. Important discoveries in many branches of science and of manufactures have in this Exhibition been brought under the notice of the public; and it seems just that those who have rendered services of this kind to the world, should receive a special mark of acknowledgment on an occasion which has required so conspicuous the advantages which the many have derived from the discoveries of the few.

The grant of the Council Medal for beauty of design, and for excellence in the fine arts, as applied to manufactures, though made upon a somewhat different principle, is also compatible with the views of the Commissioners, since in the cases in which it has been given it does not mark any greater comparative excellence of manufacture, or assign to one producer a higher place than is accorded to others; but is to be regarded as a testimony to the genius which can clothe the articles required for the use of daily life with beauty that can please the eye, and instruct and elevate the mind. Variable as this Exhibition has proved in many respects, it appears to the Commissioners that there is no direction in which its effects will be more sensibly and immediately perceived than in the improvement which is may be expected to produce in taste, and the impulse it has given to the arts of design, and a special

acknowledgment is justly due to those who have afforded the best examples of art, whether pure or applied, and led the way in this interesting career of improvement.

It now remains for the Commissioners once more to return to your Lordship and your Colleagues their cordial thanks; and they must not omit to include in these acknowledgments those gentlemen who have in various ways assisted you in your labours, particularly those who have acted with you as Associates or Experts, for the purpose of assisting your judgment in matters requiring very minute and special knowledge of particular subjects; and the Commission are well aware that these gentlemen have frequently been of the greatest service. In the hope that the Jurors and Associates might desire to possess a lasting memorial of the Exhibition, a Special Medal has been struck in commemoration of their important services.

It is the intention of the Commissioners to publish not only the names of those to whom the Juries have awarded Prizes, but also the valuable Reports which they have prepared on the state of science, art and manufactures, in the several branches of the Exhibition with which the Juries have been conversant. The Royal Commissioners fully appreciate the zeal and talent displayed by those Jurors who have accepted the laborious office of Reporters to the Juries; and they doubt not that their Reports will form most interesting records of this Exhibition, and will afford important materials for ascertaining the progress of human industry, at any future time, when another review of its productions, like the present, may be determined on.

It now becomes my pleasing duty on behalf of the Royal Commissioners, to deliver my most sincere acknowledgments and thanks for the hearty co-operation and support which the Exhibition has constantly received from Foreign Countries. The Foreign Commissioners, who have left their own countries to superintend the illustration of their respective national industries at the Exhibition, have ever shown that desire to aid the general arrangements which alone has rendered possible the success of the undertaking.

To the Society of Arts, which, by its exhibitions of works of national industry prepared the way for this International Exhibition, the Royal Commission and the public feel that their acknowledgments are especially due, and the Commission have to thank that body for having carried out the preliminary arrangements to an extent which justified me, as their President, in the application which I made to the Crown for the issue of a Royal Commission.

The Commission have also to acknowledge the valuable services afforded by the eminent scientific and professional men who, on the Sectional Committees, aided most materially in founding a scientific basis on which to rear the Exhibition.

To the Local Commissioners and members of Local Committees, but more especially to those who have undertaken the onerous duties of Secretaries, our best acknowledgments are also due. Without their zealous aid it would have been impossible to have obtained an efficient representation of the industrial products of their respective localities.

And finally, we cannot forget that all the labours of those thus officially connected with the Exhibition would have been in vain, had it not been for the hearty goodwill and assistance of the whole body of Exhibitors, both Foreign and British. The zeal which they have displayed in affording a worthy illustration of the state of the industry of the nations to which they belong, can only be equalled by the successful efforts of their industrial skill. The Commission have always had support and encouragement from them during the progress of the undertaking, and they cannot forget how cheerfully they submitted to regulations essential for their general good, although sometimes producing personal inconvenience to themselves. If the Exhibition be successful in aiding the healthy progress of manufactures, we trust that their efforts will meet with due reward.

In now taking leave of all those who have so materially aided us in their respective characters of Jurors and Associates, Foreign and Local Commissioners, Members, and Secretaries of Local and Sectional Committees, Members of the Society of Arts, and Exhibitors, I cannot refrain from remarking with heartfelt pleasure, the singular harmony which has prevailed amongst the eminent men representing so many national interests—a harmony which cannot end with the event which produced it. Let us receive it as an auspicious omen for the future; and while we return our humble and hearty thanks to Almighty God for the blessing He has vouchsafed to our labours, let us all earnestly pray that that Divine Providence which has so benignantly watched over and shielded this illustration of Nature's productions, conceived by human intellect, and fashioned by human skill, may still protect us, and may grant that the interchange of knowledge, resulting from the meeting of enlightened people in friendly rivalry, may be dispersed far and wide over distant lands; and thus, by showing our mutual dependence upon each other, be a happy means of promoting unity among nations, and peace and goodwill among the various races of mankind.

ALBERT.

## LIST OF JURY AWARDS.

## GENERAL COUNCIL MEDALS.

|                                    |   |
|------------------------------------|---|
| HIS ROYAL HIGHNESS PRINCE ALBERT   | For the original conception and successful prosecution of the idea of the Great Exhibition of 1851, Joint Medal with that granted for the Model Lodging House in Class VII. |
| CHAMBER OF COMMERCE, LYONS         | For the Collection which it exhibits, in which is shown the general progress made through their exertions in the Silk Manufactures of Lyons.                                |
| EAST INDIA COMPANY, THE HONOURABLE | For the very valuable and extensive collection illustrating the Natural Resources and Manufactures of India.  |
| EGYPT, H.H. THE VICEROY OF         | For the very valuable and extensive collection, illustrating the Manufactures and Natural Resources of Egypt.   |
| FRENCH MINISTER OF WAR             | For the part taken by him in exhibiting the valuable collection of Raw Products from Algeria.   |
| SPAIN, THE GOVERNMENT OF           | For the valuable and extensive collection of Raw Products, showing the Natural Resources of Spain.  |
| TUNIS, THE BEY OF                  | For the very valuable and extensive collection illustrating the Manufactures and Natural Resources of Tunis.  |
| TURKEY, THE GOVERNMENT OF          | For the valuable and extensive collection of Raw Products, showing the Natural Resources of Turkey.   |

## CLASS I.

[The Catalogue Numbers refer to the corresponding Numbers in the Official Descriptive and Illustrated Catalogue.]

## COUNCIL MEDAL.

| NATION.        | No. in Catalogue. | NAME OF EXHIBITOR. | OBJECTS REWARDED.  |
|----------------|-------------------|--------------------|--|
| France         | 51                | Bérard and Co.     | Process for washing and purifying coals.                           |
| United Kingdom | 65                | Brookedon, W.      | Cumberland lead, condensed in blocks.                              |
| France         | 1214              | Estivant Brothers  | Brass of superior quality produced by a novel process.             |
| Prussia        | 6                 | Güttles, W.        | Treatment of arsenical ores, and the extraction of gold from them. |
| Austria        | 424               | Kleist, Baron Von  | Iron of superior quality and manufacture.                          |
| Prussia        | 649 & 677         | Krupp, Fried       | Cast steel of superior and novel quality.                          |
| United Kingdom | 480               | Pattinson, H. L.   | Process of separating silver from lead by crystallization.         |

| United Kingdom | 406               | Birch, J.                       | Machine for cutting sash and roof bars.   |
|                | 94                | Birkin, R.                      | Bobbin-net lace machine, with Jacquard.   |
|                | 138               | Black, J.                       | Paper-folding machine.  |
| United States  | 551               | Blodget, S. C.                  | Sewing machine.   |
| France         | 428               | Boland, A.                      | Kneading machine.   |
| Prussia        | 53                | Bonard Brothers                 | Jacquard, and punching machine for Jacquard cards.  |
| France         | 417               | Boris Brothers                  | Machine for making hollow bricks.   |
|                | 15                | Baranowski, J. J.               | Machine for printing and numbering tickets.   |
| United Kingdom | 144               | Brewer, O. and W.               | Rollers of wire-cloth for paper-makers.   |
|                | 27                | Calvert, F. A.                  | Wool burring and cotton-cleaning machinery and cylinders.   |
|                | 135               | Church and Goddard              | Machine for cutting card boards, and printing and preparing railway tickets.  |
|                | 86                | Claussen, P.                    | Circular hand-loom for hosiery.   |
|                | 78                | Crawhall, J.                    | Machine for manufacturing hemp ropes.   |
|                | 35                | Crichton, D.                    | New taking-up motion for a loom.  |
| Tuscany        | 59                | Cuyere, Mrs.                    | Weavers' reeds.   |
| United Kingdom | 80                | Davenport, J. L.                | Various machines for manufacturing silk.  |
|                | 226               | Dalgaty, A.                     | Small lathe, with self-adjusting chuck.   |
|                | 45                | De Bergue, C.                   | Reeds made by machinery.  |
|                | 76                | De la Rue and Co. (Cl. xvii.)   | Envelope machine.   |
| France         | 491               | Dandoy-Mailliard, Lucq, and Co. | Rollers for spinning machinery.   |
| Switzerland    | 61                | Darier, H.                      | Press for cutting out watch-hands.  |
| France         | 823               | Dorey, J. F.                    | Machine for weaving improved healds.  |
| United States  | 456               | Earle, T. K. and Co.            | Card clothing.  |
| France         | 1607              | Frey, jun.                      | Machine for making nails.   |
| United Kingdom | 81                | Frost, J.                       | Improved silk machinery.  |
|                | 401               | Furness, W.                     | Machines for tenoning, morticing, planing, and moulding wood.   |
| Austria        | 109               | Gamba, P. The Heirs of          | Jacquard cylinder.  |
| United Kingdom | 208               | Garforth, W. J. and J.          | Steam-riveting machine.   |
| Prussia        | 58                | Hannann, A.                     | Turning lathe.  |
| United Kingdom | 102               | Harding, Pullin, and Johnson    | Machinery for making printing-types.  |
| France         | 864               | Harding-Cocker                  | Heckle.   |
| United States  | 386               | Hayden, W.                      | Drawing regulator for cotton.   |
| United Kingdom | 14                | Higgins and Sons                | Cotton machinery, and long line flax machine.   |
|                | 232               | Holtzapffel and Co.             | Amateur foot lathe, with overhead motion; slide rest and eccentric chucks, &c.; for ornamental turning, with various apparatus and tools. |
|                | 20                | Hornby and Kenworthy            | Sizing and dressing machine, and self-acting backing-off motion to a warping machine.   |
| France         | 541               | Huck                            | Apparatus for grinding and preparing alimentary substances.   |
|                | 269               | Hue, J. B.                      | Press for manufacturing hooks and eyes, cutting and beveling them at the same time.   |
| United Kingdom | 122               | Ingram, H.                      | Applegath's vertical printing machine.  |
| France         | 546               | Jacquin, J. J.                  | Circular hosiery frames.  |
| United Kingdom | 212               | Johnson, R. and Brothers        | Wire-drawing benches.   |
|                | 52                | Judkins, C. T.                  | Heald machine and improved heald.   |
|                | 21                | Kenworthy and Bullough          | Stopping motion to a power loom.  |
|                | 604               | Lawrence, J., sen.              | Refrigerator, store cask, &c.   |
| France         | 283               | Lacroix and Son                 | Fulling machine for cloth.  |
| Prussia        | 55                | Leonhardt, J. E.                | Type-founding machine.  |
| United Kingdom | 209               | Lewis, F. and Sons              | Wheel-cutting engine and roving spindle.  |
| United States  | 447               | Lowell Machine Shop             | Self-acting lathe and power loom.   |
| United Kingdom | 454               | Mawson, Elliott, and Seyrig     | Centrifugal washing and drying machine.   |
|                | 206               | Muir, W.                        | Small lathe and various tools.  |
| France         | 330               | Mareschal, J.                   | Machine for mincing meat.   |
|                | 645               | Miroude Brothers                | Card clothing.  |
| United States  | 460               | Morcy, C.                       | Eastman's stone-cutting machines.   |
| France         | 664               | Nicolas, P.                     | Machine for engraving metal cylinders.  |
| United Kingdom | 158               | Napier and Son                  | Letter-press printing machinery.  |
|                | 40                | Perry, John                     | Wool-comb.  |
|                | 5                 | Preston, F.                     | Spindles and flyers.  |
|                | 456               | Promer and Hadley               | Ornamental sawing machine.  |
|                | 74                | Plummer, R.                     | Scutching, heckling, and other flax machines.   |
|                | 6                 | Parr, Curtis, and Madeley       | Various machines for carding and spinning cotton; three self-acting mules; also various engineers' machine tools.                         |
|                | 128               | Rémond, A.                      | Envelope machine.   |
|                | 640               | Ransomos and May (Cl. v.)       | Leggatt's Queen press, with self-acting apparatus.  |
| France         | 418               | Robinsons and Russell           | Large steam sugar-cane mill.  |
|                | 1454              | Roswag, A. and Son              | Wire-cloth for paper-makers.  |
| United Kingdom | 222               | Ryden, W.                       | Forging machine.  |
| France         | 1474              | Sautreuil, jun.                 | Machine for planing and moulding wood.  |
|                | 1475              | Schwerber, G.                   | Forging machine.  |
|                | 1001              | Schneider and Legendrand        | Shearing machine.   |
|                | 1005              | Scrive Brothers                 | Card clothing.  |
| United Kingdom | 22                | Smith, M.                       | Various power looms.  |
|                | 220               | Shepherd, Hill, and Spink       | Self-acting slide lathe.  |
|                | 230               | Smith, Beacock, and Tappin      | Self-acting slide lathe, drilling, and planing machines.  |

| France . . . . .         | 126  | Collin, C. Es . . . . .               | Map engraving.   |
| United Kingdom . . . . . | —    | Corporation of London . . . . .       | Illustrations of the art of ship-building for the commercial marine, almost all showing the greatest and most important improvements in strength, symmetry, and efficiency; and mostly coming from the establishments within the jurisdiction of the Port of London. |
| France . . . . .         | 1057 | Claudin, F. . . . .                   | Guns, rifles, and pistols.   |
| United States . . . . .  | 249  | Darton, W. . . . .                    | Models of merchant-vessels.  |
| United Kingdom . . . . . | 223  | Dease, Adams, and Deane . . . . .     | Double and single guns and pistols.  |
| — . . . . .              | 55   | Dent, E. J., (Cl. x.) . . . . .       | Successful attempt to construct a compass that should not be disturbed by the motion of the ship at sea, nor by the firing of guns on board.   |
| France . . . . .         | 473  | Delvigne, G. . . . .                  | Apparatus for saving life from shipwreck. A projectile discharged by means of a howitzer. This invention involves a new principle, that of a portion of the line to be carried out being contained in the projectile.  |
| — . . . . .              | —    | De Récaméuil . . . . .                | His improvements in the shading of maps, by printing different colours at the same time.   |
| — . . . . .              | 166  | Devissac, — . . . . .                 | Sporting guns and arms.  |
| United Kingdom . . . . . | 30   | Ditchburn, T. J. . . . .              | Models of paddles and screw steam-vessels.   |
| — . . . . .              | 302  | Edgington, B. . . . .                 | Tents.   |
| Lübeck . . . . .         | 5    | Fischer, C. A. . . . .                | Double gun, rifle, and pistols.  |
| United Kingdom . . . . . | —    | Fox, Alfred . . . . .                 | Fine specimens of nets, seine, &c., for pilchards.   |
| France . . . . .         | 1612 | Gauvain, J. . . . .                   | Pistols, form and execution; sporting guns, &c.  |

| NATION.        | No. in Catalogue. | NAME OF EXHIBITOR.                       | OBJECTS REWARDED.  |
|----------------|-------------------|--|--|
| France         | 1611              | Gastinne-Ronette                         | Sporting guns and arms.  |
| United Kingdom | 59                | Greener, W.                              | Guns, barrel perfectly forged and finished. Harpoon guns, for whale fishery, and for saving life from shipwreck.   |
| —              | 131               | Green, Messrs.                           | Specimen model of a fine merchant vessel designed and built by them for the East India trade.  |
| —              | —                 | Groom, J. J.                             | Specimens of deep-sea fishing-lines and hooks.   |
| —              | —                 | Hawker, P., Colonel                      | His improvements and perfection in punt guns.  |
| —              | 136               | Hinks, Henry                             | Design of a life-boat. Also recommended for the prize of 100 guineas, to be awarded by the Duke of Northumberland.   |
| France         | 1628              | Houllier-Blanchard, H.                   | Pair of pistols and apparatus.   |
| Belgium        | 139               | Jansen, A.                               | Collection of sporting and ornamental guns.  |
| United Kingdom | 188               | Jeffery, Walsh, and Co.                  | Specimens showing the advantages of marine glue, as a substitute for pitch and for other purposes connected with ship-building.  |
| —              | 21                | Jerningham, Captain, R.N.                | An anchor, bent on a line, to rise from a Manby mortar a sufficient distance to afford the means of hauling a life-boat through the surf.  |
| —              | 226               | Lang, J.                                 | Double and single guns and pistols.  |
| France         | 385               | Lahure, —                                | Iron life-boat.  |
| United Kingdom | 195               | Laurie, R. W.                            | Buoyant mattresses, &c.  |
| France         | 1083              | Legoff, Captain                          | An excellent system of stopping chain cables.  |
| Belgium        | 151               | Lardinois, N. C.                         | Target rifle, with accessories of every kind.  |
| France         | 1547              | Leopold, Bernard                         | Double and single barrels, of damasque workmanship.  |
| Belgium        | 145               | Lepage, —                                | Numerous collection of sporting and trade guns.  |
| France         | 1364              | Lepage Moutier.                          | Sporting guns; ornamental arms; swords and side-arms of De Luynes; damasque of remarkable novelty.   |
| United Kingdom | 22                | Manby, Capt. G. W. (Representatives of). | Mortar apparatus, for shipwreck purposes. The object of this instrument is that of saving life from shipwreck, by means of firing a projectile, with a line attached, over a vessel when on shore. |
| —              | 149               | Marc, C. J. and Co.                      | Models of sailing and steam vessels, both paddle and screw; ditto of yachts, designed and built for various merchants' services.   |
| —              | 267               | Mortimer, T. E.                          | Guns, rifles, and pistols.   |
| —              | 158               | Nipier and Son (Cl. VI.)                 | A compass used for registering the hourly deviation of the needle, and for detecting errors in the steering of a ship.   |
| United Kingdom | 260               | Noedham, Henry                           | Guns, rifles, and pistols.   |
| —              | 270               | Parson, W.                               | Guns, rifles, and pistols.   |
| —              | 136               | Piercy, J. and E. Pellew                 | A good specimen of a life-boat.  |
| Belgium        | 146               | Promdeur, N.                             | Best guns, rifles, and pistols.  |
| United States  | 446               | Pook, S. M.                              | Models of ships of war.  |
| United Kingdom | 244               | Reeves, Graves, and Co.                  | Swords and other side-arms artistically embellished.   |
| Belgium        | 141               | Ronkin Brothers                          | Numerous collection of sporting and trade guns.  |
| United Kingdom | 290               | Rhind, W. G.                             | Deck-seat to form raft. This seat can be readily formed into a safety raft, capable of sustaining eight people.  |
| —              | 240               | Richards, Westley                        | Best guns and sporting guns.   |
| —              | 236               | Rigby, W. and J.                         | Guns, pistols, and rifles, and barrels of damasque.  |
| —              | 291               | Rigmaiden, Lieut. J., R.N.               | Model of improved mode for setting up the standing rigging of ships.   |
| —              | 193               | Robinsons and Russell                    | Models of steam boats, designed and built by them.   |
| France         | 991               | Roemer, M.                               | Distilling and cooking galley.   |
| United Kingdom | 336               | Rodger, Lieut. W., R.N.                  | Models of improvements in form of anchors.   |
| —              | 294               | Royal Thames Yacht Club                  | Models of vessels belonging to their Club.   |
| —              | —                 | Saunders, J. E. (Cl. XXIX.)              | Model of a welled smack for fishing, fitted with auxiliary screw propeller. A novel application to vessels of this description.  |
| —              | —                 | Semmens, J. and T. W.                    | Model of Mounts Bay fishing-boat. A fine description of boat for the purpose.  |
| France         | 1475A             | Schneider, —                             | Specimen and plans of steam-boat "L'Océan," for the river Rhone, which vessel has attained great speed and rendered much service to the commerce on that river.                                    |
| Switzerland    | 68                | Sauerbrey, V.                            | Target rifle.  |
| United Kingdom | 125               | Smith, S.                                | Model of a spring machine, for modelling ships of any form or dimensions; an ingenious and ready means of setting up a design in model.  |
| —              | 305               | Smith, Thomas and William                | Specimen model of fine merchant vessels; designed and built by them for the East India trade.  |
| France         | 1478              | Sochet                                   | Distilling-apparatus.  |
| United Kingdom | 266               | Toosdel, Wm.                             | For a good specimen of a life-boat.  |
| Belgium        | 155               | Tourey, —                                | An ornamental double gun, guns and arms.   |

| NATION.                  | No. in Catalogue. | NAME OF EXHIBITOR.             | OBJECTS REWARDED.   |
|--------------------------|-------------------|--------------------------------|---|
| United Kingdom . . . . . | 222               | Trulock and Son . . . . .      | Guns, pistols, and rifles, and barrels of good damasque.  |
| — . . . .                | 185               | Tutt, G. (Cl. XXIX.) . . . . . | Model of a Hastings fishing lugger; a very fine description of boat for the purpose.                            |
| — . . . .                | 36                | White, J. . . . .              | Models of vessels for merchant service, and yachts; designed and built by him.                                  |
| — . . . .                | 36A               | White, T. J. and R. . . . .    | Models of fine sailing and steam vessels and yachts.  |
| — . . . .                | 56                | Wigram, M., and Sons . . . . . | Models of sailing and steam vessels, both paddle and screw; designed and built for various merchants' services. |
| — . . . .                | 200               | Wilkinson and Son . . . . .    | Guns, rifles, pistols, and swords; swords highly ornamented.  |
| Spain . . . . .          | 264               | Zuloaga, E. . . . .            | Fire-arms and swords.   |

| Frankfort-on-the-Maine . . . . . | 6    | Weber and Schultheis . . . . .      | Two rifles.  |
| United Kingdom . . . . .         | 203  | Witton and Daw . . . . .            | Guns and rifles.   |

## MONEY AWARDS.

|                          |     |                           |   |
|--------------------------|-----|---------------------------|---|
| United Kingdom . . . . . | —   | Birnie, Alex. . . . .     | A complete set of fishing-nets, lines, and hooks, for deep-sea fishing, 50l.  |
| — . . . .                | —   | Bothway, Joseph . . . . . | Models of his improvements in the construction of blocks, combining strength and other advantages with much less weight, 50l. |
| — . . . .                | 174 | Dempster, H. . . . .      | An ingenious system of signals for merchant ships, 20l.   |
| — . . . .                | 159 | Harvey, David . . . . .   | A model of the "Victoria and Albert" yacht, executed by him, being a fine specimen of workmanship, 40l.                       |

CLASS IX.

COUNCIL MEDAL.

| NATION.        | No. in Catalogue. | NAME OF EXHIBITOR. | OBJECTS REWARDED.  |
|----------------|-------------------|--------------------|--|
| United Kingdom | 15                | Busby, W.          | Two or four horse plough, horse-hoe on the ridge, ribbing corn drill, and cart.  |
| —              | 135               | Crosskill, W.      | Norwegian harrow, meal mill, cart, clod-crusher, and gorse-bruise.   |
| —              | 142               | Garrett and Sons   | Horse-hoe, general purpose drill, four-row turnip drill on the flat, improved hand-harrow drill for grass seeds, steam engine and thrashing machine. |
| —              | 233               | Hornsby and Sons   | Corn and seed drill, drop drill, two-row turnip drill on the ridge, oil-cake bruise, steam-engine.   |
| United States  | 73                | McCormick, C. H.   | Reaping machine.   |

PRIZE MEDAL.

|                |      |                                 |   |
|----------------|------|---------------------------------|---|
| United Kingdom | 132  | Ball, W.                        | Two-horse plough.                                   |
| —              | 128  | Barrett, Exall, and Andrews     | Steam-engine and linseed and corn crusher.          |
| —              | 217  | Bentall, E. H.                  | Cultivator dynamometer.                             |
| —              | 237  | Burgess and Key                 | Improved American churn and turnip cutter.          |
| —              | 37   | Burrell, C.                     | Gorse bruise.                                       |
| Belgium        | 163  | Clacs, P.                       | Corn drill and roller.                              |
| United Kingdom | 242  | Clayton, Shuttleworth, and Co.  | Steam engine.                                       |
| —              | 47   | Clayton, H.                     | Tile machine.                                       |
| —              | 216  | Coleman, R.                     | Cultivator expanding harrow.                        |
| —              | 143  | Comins, J.                      | Horse-hoe.  |
| —              | 205  | Comes, James                    | Chaff cutter.                                       |
| —              | 96   | Crowley and Sons                | Cart.   |
| Belgium        | 510  | Delstarthe, P.                  | Plough.   |
| —              | 166  | Duchene, J. J.                  | Churn.  |
| United Kingdom | 129  | Gibson, M.                      | Clod crusher.                                       |
| —              | 150  | Gray and Sons                   | Cart.   |
| —              | 149  | Hensman and Son                 | Thrashing machine, four-horse plough, corn drill.   |
| —              | 241  | Holmes and Sons                 | Thrashing machine.                                  |
| —              | 240  | Howard, J. and F.               | Two-horse XX plough, four-horse plough, horse rake. |
| —              | 414  | Hurwood, G. (Cl. vi.)           | Meal mill.  |
| Netherlands    | 74   | Jenken, W.                      | Plough.   |
| France         | 1299 | Lavoisy, A. D.                  | Churn.  |
| United Kingdom | 124A | Newington, Dr. S. (as Inventor) | Top-dressing machine.                               |
| —              | 50   | Nicholson, W. N.                | Oil-cake bruise.                                    |
| Belgium        | 169  | Odeurs, J. M.                   | Plough.   |
| United States  | 404  | Prouty and Mears                | Plough.   |
| United Kingdom | 124  | Ransomes and May                | Drop drill.   |
| —              | 108  | Reeves, T. R. and J.            | Water drill and liquid-manure distributor.          |
| —              | 185  | Samuelson, B.                   | Turnip cutter.                                      |
| —              | 228  | Scrapp, T.                      | Tile machine.                                       |
| —              | 234  | Smith and Co.                   | Haymaker, chaff cutter, horse rake.                 |
| —              | 1    | Stanley, W. P.                  | Linseed and barley crusher.                         |
| France         | 1028 | Talbot Brothers                 | Plough.   |
| United Kingdom | 271  | Tuxford and Sons                | Steam engine.                                       |
| —              | 220  | Wilkinson, T.                   | Churn.  |
| —              | 151  | William, W.                     | Light and heavy harrows.                            |
| —              | 238  | Whitehead, J.                   | Tile machine.                                       |
| France         | 705  | Vacher, Son, and Co.            | A seed and corn separator.                          |

HONOURABLE MENTION.

|                |     |            |                  |
|----------------|-----|------------|------------------|
| United Kingdom | 28A | Fowler, J. | Draining plough. |
|----------------|-----|------------|------------------|

## CLASS X.

## COUNCIL MEDAL.

| NATION.          | No. in Catalogue | NAME OF EXHIBITOR.                   | OBJECTS REWARDED.   |
|------------------|------------------|--------------------------------------|---|
| United Kingdom   | 431              | Bain, A. . . . .                     | Electric telegraph.   |
|                  | 433              | Beckwell, F. . . . .                 | Copying electric telegraph.   |
| United States    | 463              | Bond, Wm. and Son                    | The invention of a new mode of observing astronomical phenomena, &c.  |
| France . . . .   | 1108             | Bourdon, Fe . . . .                  | The invention of metallic barometers, and for his manometers.   |
| United Kingdom   | 429              | Brett, J. . . . .                    | Printing telegraph.   |
|                  | 144              | Brooke, C. . . . .                   | The invention of a means of self-registering natural phenomena, by photography.   |
|                  | 301              | Buckle, S. (Cl. xxx.)                | Photographs on paper.   |
| France . . . .   | 443              | Büron.                               | Good telescopes, the object-glass being of rock crystal.  |
| United Kingdom   | 22               | Chance, Brothers and Co. (Cl. xxiv.) | A disc of flint glass, 29 inches diameter.  |
|                  | 296              | Claudet, A. F. . . . .               | Inventions based upon experiments in the practice of photography; and non-inverted pictures.  |
| Switzerland. . . | 75               | Daguet, F. . . . .                   | Superiority of glass for optical purposes, good specific gravity, clear; crown-glass as clear as flint.   |
| France . . . .   | 260              | Darcueil, L. J.                      | Balance air-pump; and for the invention of an arrangement to keep the charcoal points in electric light at a constant distance.   |
| United Kingdom   | 145              | Dollond, G.                          | Atmospheric recorder, by means of which the readings of the barometer, those of the thermometer evaporator, fall of rain, direction of the wind, its strength, electric state of the air, &c., are simultaneously registered.   |
| France           | 1197             | Duboscq-Soleil, J.                   | A very ingenious heliostat, on a new construction, by Silbermann; the invention of an apparatus for fixing the charcoal points for electric light; a saccharometer of delicate structure, and much ingenuity, and an elegant and novel instrument, by Brevais, for exhibiting the phenomena of polarized light. |
| United Kingdom   |                  |                                      | Extraordinary application of mechanism to his steel expanding figure of a man.  |
| France . . . .   | 160              | Froment, G. . . . .                  | The goodness of the work of his theodolites, and divided meter.   |
| Tuscany . . . .  |                  | Gonnella, Professor T. . . . .       | Planimeter, a machine for measuring plane surfaces.   |
| United Kingdom   | 331              | Griffith, Rev. J.                    | Barometer, with a vacuum capable of complete restoration by an air-trap at the top.   |
|                  | 428              | Henley, W. T.                        | The convenient and ingenious application of magnetic electricity to the purpose of electric telegraphs.   |
| Netherlands      | 87               | Logeman, W. M.                       | Excellence of the magnets shown by him.   |
| France . . . .   | 610              | Martens, F. . . . .                  | Talbotypes on glass by the albuminous process.  |
| Bavaria . . . .  | 30               | Moriz and Sons . . . . .             | Equatorial, combining cheapness with excellence of workmanship.   |
| United Kingdom   | 674              | Newman, J.                           | The originality, excellence, and perfection of his air-pumps, and self-registering tide gauge.  |
|                  | 334              | Oertling, L.                         | Very delicate large and small balances.   |
| France . . . .   | 1683             | Quennessen                           | A platina alembic, to hold 250 pints, all in one piece, without solder or seam, &c.   |
| United Kingdom   | 254              | Ross, A. . . . .                     | Great improvements in microscopes, and for the solidity of structure, good mechanism, and distribution of strength, great size, &c., of his large equatorial.   |
| Prussia . . . .  | 299              | Ross and Thomson. (Cl. xxx.)         | Great improvements in photography.  |
| United Kingdom   | 310A             | Siemens and Halske . . . . .         | Electric telegraph.   |
| France . . . .   | 253              | Smith and Beck . . . . .             | Excellence of their microscopes.  |
|                  | 386              | Taurines . . . . .                   | Dynamometer exhibited and manufactured by B. Tajfer and Co.   |
| United Kingdom   | 26               | Vidi                                 | The invention of the aneroid barometer.   |

## PRIZE MEDAL.

|                 |      |                       |                           |
|-----------------|------|-----------------------|---------------------------|

## CLASS I.

# REPORT ON MINING, QUARRYING, METALLURGICAL OPERATIONS, AND MINERAL PRODUCTS.

The figures after the Names (between parentheses), refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

### Jury.

Sir HENRY DE LA BECHE, C.B., F.R.S., *Chairman*, 28 Jermyn Street, Piccadilly; *Director-General* of the Geological Survey of the United Kingdom.

DUFRENOY, *Deputy Chairman and Reporter*, France; *Member* of the Institute of France, *Inspector-General* of Mines, &c.

M. FARADAY, D.C.L., F.R.S., Royal Institution, Albemarle Street; *Professor* of Chemistry in the Royal Institution.

C. J. M. GERNAEHT, Belgium; *Engineer-in-Chief* of the Corps of Miners.

W. E. LOGAN, F.R.S., Canada; *Director* of the Geological Survey of Canada.

FLORINAND SCHRIEBER, Zollverein; *Mining Engineer*.

RICHARD TAYLOR, F.G.S., 6 Queen Street Place, Upper Thames Street, and Truro; *Mineral Surveyor* to the Duchy of Cornwall.

Professor TUNNER, Austria; *President* of Imperial Mining School, Leoben, Styria.

### Associates.

GABRIEL KAMENSKY, Russia; *Councillor* of the Administration of Finances. (Juror in Class VIII.)

THE mineral kingdom, which plays so important a part in modern industry, furnishing raw materials for our manufactures and tools for our works, and supplying fuel for our steam-engines, the invention of which has outstripped the power of man, cannot be satisfactorily represented in an Universal Exhibition.

Its products possess immense utility, and yet offer but little brilliancy of appearance. Deprived of all that gratifies the eye by elegance of form and varieties of colour, they can scarcely neutralize these disadvantages and arrest attention, unless by research into their peculiar conditions, their singular and strange forms, and their colossal dimensions, which excite surprise from the great difficulties overcome in their preparation. But such sources of interest are essentially fugitive, and generally barren of result, and the interest thus excited is no adequate reward for the labour, care, and expense that have been incurred in producing them, and they rarely introduce new outlets for the industry which has been displayed in forwarding them.

These difficulties are inherent. An exhibition, more-over, of metalliferous minerals cannot afford, as is the case with agricultural and manufacturing products, a complete comprehension of the ingenious and powerful methods which have either obtained or simplified their extraction, or the multiplied labours by which they have been procured.

Agriculture ameliorates and increases the products of the earth: the skill of the weaver is shown in the beauty of his fabrics, and it is easy for the observer, however inexperienced, to render an account of it, either to himself or to the public. For minerals, on the contrary, an attentive and prolonged examination often only affords a somewhat incorrect idea of their real value, and of the advantages which may arise from their 'exploitation.' The beauty of the specimens is often only a deceitful guide.

If it be true that the importance and commercial value of an 'exploitation' depend upon the riches of the raw material, and the facility of its extraction, it is only in the works themselves, or in the mine, that this double condition of its value can with any certainty be appreciated.

Certain mines of copper afford a good illustration of

\* We may refer to specimens of lead ore consisting of cubes nearly 3 feet across, and blocks and obelisks of granite more than 40 feet high. Messrs. Bagnall and Jesson (53, pp. 115-117), exhibit a sectional column of the South Staffordshire thick coal nearly 40 feet high, showing the whole thickness of the seam.

this fact. Most of the specimens obtained from these mines yield as much as 60 per cent. of metal; but still they are not worked to profit, owing to the small quantity of the ore irregularly distributed through veins of which the greater part is barren.

The mines of Cornwall, on the contrary, the ores of which afford only about 8 per cent. of metal, even after dressing, are very profitable to the adventurers.

The abundance of these ores is so great, that they furnish nearly two-thirds of all the copper obtained from the mines of the whole world.

These remarks appear useful at the commencement of this Report, as explanatory of the numerous omissions which have to be regretted in the Great Exhibition, in reference to the products of the mineral kingdom. Without casting blame on the great establishments of Europe, and elsewhere, which have rendered themselves remarkable by their absence, they constitute the best eulogium of those who have had the courage to sacrifice all personal considerations to the honour of the industry they represent. Without expecting any considerable benefit, without any prospect of opening new markets, they have been, nevertheless, desirous of offering their disinterested tribute, and of adding to the effect of an event which will form an epoch in the history of the industry and civilization of the world.

The exhibition of the various productions of the mineral kingdom presented in the Crystal Palace is therefore very incomplete. Saxony and the Harz, those cradles of mining, which for so long alone in Europe enjoyed the honour of possessing mining schools, have sent none of their products. Sweden and Norway, likewise very rich in mines, are chiefly represented by magnificent specimens of native silver as remarkable for their dimensions as for the beauty of their crystallization.

Spain, which supplies so large an amount of mercury to the whole world, and of which the lead mines were once sufficiently important, in the abundance and richness of the ore, to govern the markets of Europe, has only sent a few detached specimens, so that the exhibition from this country gives no evidence of the mineral wealth of the Peninsula. The Jury have thus been unable to award to

\* These specimens (exhibited as No. 34, Sweden) are 34 in number, and we have particularly noticed four amongst them, viz. 1. A specimen weighing two ounces, having very distinct and well-formed cubical crystals. 2. One in cubo-octahedral crystals, weighing 67 ounces. 3. One in octahedrons, weighing 48 ounces; and 4. one weighing at least 10 lbs. composed of large twisted fibres.

the Spanish exhibitors more than a single Prize Medal and a few Honourable Mentions. Even these have been given for the manufacture of iron and steel, and the working of marble,—classes of industry which are but of secondary importance in that kingdom.

We ought here to remark, that the prizes have been awarded entirely on the examination of the objects exhibited. They do not, therefore, in any way represent the industrial position of the countries which have obtained them, and often indeed give no indication of the real importance of the establishments to which they have been awarded. These apparent anomalies, which every one may discover with regard to works with which he is himself acquainted, are the result of this necessary condition of a Universal Exhibition, where the members of the Jury cannot have a personal knowledge of the establishments whose products they examine, and are therefore unable to admit, in forming that opinion, any considerations derived from what the Exhibition.

Several of the numerous copper-works of Russia, and also the gold washings of that vast empire, perhaps as rich as those which now attract attention in California, are unrepresented by any collection. The only important objects sent by Russia, belonging to this class, consist of specimens of pig bar, and rolled iron from the Imperial and other manufactures, with specimens of copper in cake and in sheets; some of them being accompanied by ores and slags of the furnaces in different states. These interesting collections give a sufficiently complete idea of the mode of treatment adopted in the different works whence they are forwarded, and permit a comparison with the methods employed in the other metalliferous districts of Europe.

The mineral industry of Austria, Belgium, France, and of Germany within the Zollverein, or Custom League, although very imperfectly represented in the Exhibition, includes objects of the greatest interest. Each of these countries has obtained the Council Medal, and a considerable number of Prize Medals.

The Exhibition of Great Britain is sufficiently complete in those objects that have reference to the production of metals of daily usage, especially iron and steel, the series representing these important branches of industry, including in most cases the ores of iron, and then products in different states, while in a few the collections are accompanied by models of the furnaces in which the metal is reduced. There exist also several collections of ores valuable for instruction, amongst which we may notice especially that exhibited by Mr. BLACKWELL (pp. 143—152), of Dudley, who has sent a series comprising specimens of all varieties of iron ore worked in Great Britain. The study of this collection is equally interesting to the mineralogist and the geologist, as well by the different nature of the ores as by their mode of occurrence.

Notwithstanding the questions so much to be regretted, and which we have just alluded to, the exhibition of objects in this class still possesses the greatest interest, and is in the highest degree instructive; and it results from it, on a careful investigation, that in all parts of the world, in Europe as well as America, the mineral has everywhere followed the development of other industries. The difference of price of the raw material, or to speak more accurately, the abundance of fuel, and its more or less favourable distribution, regulate in each country the cost of manufacture, although it is chiefly with regard to smelting operations and the working of iron that this influence shows itself on the largest scale. The methods of working are everywhere acquiring a certain uniformity of system, the old processes, where human labour was so largely introduced, being replaced by modern contrivances which diminish the amount of manipulation and the general expense. The only remark that one can venture to make is, that wherever fuel is abundant it is more wastefully used; and that the countries where smelting operations and iron are the dearest, are perhaps, on the other hand, those where economy of fuel is carried to the greatest extent, and where the work has really attained the greatest perfection.

The Royal Commission which presided over the Exhibition had the happy idea of including geological maps

among the objects which ought to appear in it, as one of the most useful means of advancing mineral industry. Many of these maps have been distinguished by the Jury, and will be honourably noticed in the summary description of objects that have obtained rewards. The most important of all, however, that of England, prepared under the superintendence of Sir HENRY T. DE LA BECHE, Director-General of the Geological Survey, could not receive any award in this class, that gentleman being the Chairman of the Jury; and it is, therefore, necessary to speak of it in this short preliminary sketch of the *ensemble* of the Exhibition. It is executed on the Ordnance map prepared and published by Government. The scale of this map (1 inch to a mile, or 1 in 63,360) is sufficient to represent in detail the outline, or the boundary of all the geological formations, and it even allows the direction of the principal metalliferous and other veins to be indicated when they are known for any distance. This great work, at present the only one of its kind, is a model which we may hope will be imitated by the principal Governments on the Continent. Science may then, within a limited time, be enriched by a complete geological map of the whole of Europe. It is true that France already possesses a geological map, which I may be allowed also to cite; and there are also a number of departmental geological maps, many of which are executed with great talent; but these are not all on the same scale, and the details are not of the same kind, so that there are certain discrepancies which prevent our being able to unite them all in a single sheet, and thus form a complete result. The new map of France, which is in no respect inferior to the Ordnance map of England, either in accuracy or execution, furnishes the groundwork for a geological map equal to that which has been prepared by Sir H. De la Beche and the officers of the Geological Survey, England, which laid the first foundation of the true study of stratified deposits by the sections of W. Smith, and the important map of Mr. Greenough, has still the honour of giving to the world a model for the execution of a detailed geological map, applicable at once to industrial researches and agricultural improvement.

Before commencing the detailed description of objects which have obtained Medals or Honourable Mention, we feel bound to mention also the interesting collection from Canada, procured by Mr. LOGAN (pp. 958—961), Director of the Geological Survey of that Colony, and a series of copper ores, with model of a mechanical preparation of working these ores, exhibited by Mr. RICHARD TAYLOR, Mineral Surveyor of the Duchy of Cornwall. These two gentlemen, being both of them members of the Jury, they, as well as the Chairman, Sir H. De la Beche, are of necessity excluded from receiving honorary awards in this class.

The collection from Canada is accompanied by a geological map, which will, we hope, be very soon published.

The model, showing the mechanical preparation of copper ores, of which Mr. Taylor is the exhibitor (434, p. 161), presents remarkable differences when compared with the methods generally employed in Cornish mines. The method is more especially intended for the poorest ores, called *Halcons*, and admits of a larger proportion of the copper being obtained than is the case with any other methods now in use.

The Jury have considered that they are not justified in adjudging any reward to those who have exhibited objects of Natural History, unless these have been obtained by special researches on the part of the exhibitor.

In consequence of this decision, isolated minerals and geological specimens not connected with distinct operations have been excluded from competition; but we consider that it will be useful to science if we append, as a note to the above general resume, a notice of such specimens as are extraordinary for their dimensions or for the perfection of their forms.

Amongst such specimens must be mentioned, as of the first class in point of interest, a magnificent crystal of emerald, the property of the Duke of Devonshire (14, p. 122), obtained from New Granada. It is a regular six-sided prism, perfectly well formed. Two of the parallel faces are more developed than the others, so that the hex-

apical base of the crystal has one side larger than the rest. The dimensions of the base are 2.36 inches by 1.97 inch, and the height of the prism 0.165 inch. Notwithstanding these dimensions, almost gigantic for this kind of mineral, this emerald, which is of a fine green colour, is perfectly clear in the upper part. The lower part, which is attached to the rock, presents many flaws, probably the result of a blow by which it was detached from the veinstone.

The Duke of Devonshire is also the exhibitor of two crystals of quartz, attached by one of the vertical faces, the crystals being each of them 2½ feet high by 8 inches in diameter. The pyramidal summits of these crystals, which rise nearly a foot above the prism, are completely transparent, but the prisms are cloudy. These magnificent crystals were obtained from the Alps, having been discovered during the formation of the road over the Simplon, in a pitting made through the old rocks.

In a series of minerals sent by the ROYAL TECHNOLOGICAL INSTITUTE OF TUSCANY, we cannot pass over a specimen of granite rock from Elba, measuring about 19 inches by 1½, having one side covered with magnificent crystals of felspar, upwards of a hundred in number. These crystals, which occupy a fissure or small vein in the rock, are entirely detached. They measure 2.36 inches in height by 1.77 across between the faces  $g'$ ; their form, extremely well defined, is a six-sided prism, composed of the four primitive faces  $M$  and the modifications  $q'$ ; they are terminated by the base  $P$ , and the angles  $a$  and  $a'$ . The enlargement of the base of the faces  $a$  and  $a'$ , gives to these crystals a peculiar arrangement observed in the large-grained granites of the centre of France, especially in those of La Loozère and Le Forçat.

DON FRANCISCO IGNACIO OSSA, DON MIGUEL GALLO, and DON RAMON GOYENECHE, have exhibited together a magnificent specimen of native silver, weighing 154 lbs., obtained from the mine of Descubridora, near Chancarcillo, in Chili. It was found in this mine in 1850, at a depth of 200 feet, in the vein called Augusta. The dimensions of this specimen make it an object very remarkable in natural history; but it is especially interesting by its structure, being formed of successive layers folded on each other like some of the beds of the coal measures. These layers do not appear to be due to successive concretions, as is the case with kidney-shaped nodules of native arsenic.

The only other object we shall refer to are a specimen of a lead vein from the Laxey mines, and a magnificent lump of galena from the mines of Snailbatch, near Shrewsbury.

The fragment from Laxey represents the total thickness of the lode, which amounts to 23½ inches, nearly. The specimen is about 5 feet long by 30 inches wide. It consists of five solid veins of galena separated by thin bands of sulphate of barites; and the specimen, which is one of the finest that we have seen, gives a complete idea of a metallic vein. The owner has presented it to the Museum of Practical Geology, where it will be of great interest as illustrating the formation of veins.

The specimen from Snailbatch mines is still more curious. It is composed of an assemblage of large cubes of galena, measuring 3.15 inches a side, and of rhombohedral crystals of violet-coloured calc spar 9½ inches long, the edges being replaced by large facets belonging to the obtuse scalenohedron  $h$ ; these are smooth and bright, but the faces of the rhombohedron are, on the contrary, bristled, with high points consisting of the ordinary metastatics arranged in their natural position relatively to the axis of the rhombohedron, so that the faces of all these points are parallel. This specimen, remarkable both for the dimensions of the cubes of galena and the crystals of carbonate of lime, measures about 56 inches by 43½ inches, its thickness being about 14 inches.

#### ON THE PRIZES AWARDED AND THE MOTIVES BY WHICH THE JURY HAVE BEEN INFLUENCED.

The examination of all the objects relative to mines, quarries, and metallurgical operations, and the collection of mineral products exhibited in the Crystal Palace, was carried on simultaneously by different members of the Jury. To give greater authority to their decisions, they

obtained the assistance occasionally of persons whose special knowledge might assist them. This assistance they availed themselves of, especially with regard to the various specimens of iron; for the determination of which, they called in four qualified persons, whose practical knowledge afforded every guarantee of a just and due appreciation. After this circumstantial examination, the Jury divided the list of those whom they consider worthy of reward into three classes; the rewards being as follows:—

1. COUNCIL MEDALS, for such objects as, according to the terms originally decided on, exhibit either novelty in the mode of obtaining or applying raw materials and produce, or skill and excellence in known modes of obtaining, applying, or adapting them.

2. PRIZE MEDALS for comparative excellences in the quality obtained, combined with utility.

3. HONOURABLE MENTION of those objects which, without attaining the superiority required for the Prize Medal, offer notwithstanding great merit of execution or the application of new and ingenious methods still requiring the sanction of long experience.

This last class has been divided into two; but it would be difficult to define very accurately the difference between them. To explain the difference, we may, however, be sufficient to say that the Jury have sometimes had doubts as to whether several of those in the First List of Honourable Mentions ought not to have been rewarded with the Prize Medal. Difficulties of this kind have never presented themselves in drawing the line between the Honourable and Ordinary Mentions, and the opinions of the Jurors have been in all cases unanimous with regard to the latter.

#### COUNCIL MEDALS.

The Council Medals, having been awarded in the manner above indicated, for novelty in the mode of obtaining and applying raw materials, sanctioned by experience, or for undoubted superiority in manufacture, we begin by giving some details on the methods or kinds of industry that have merited them. With regard to the Prize Medals and Mentions, a general account will afterwards be given of them in the order of the respective countries to which they belong.

#### MANUFACTURE OF BLACK-LEAD PENCILS BY MR. W. BROCKEDON. (65, p. 128.)

Drawing pencils of the first quality, known in commerce as "Brookman's," are made with small prisms sawed from pure massive graphite, and placed in grooves in wood. Pieces of graphite sufficiently large to be thus used are very rare, and the mine of Borrowdale, in Cumberland, whence they have been obtained, is almost entirely exhausted. Mr. Brockedon was long occupied in seeking for some method which might enable him to employ the powder of pure graphite without cementing it by any substance, which inevitably injures the quality. He endeavoured to render the powder coherent by submitting it to enormous pressure; but the different machines and apparatus he at first made use of for this purpose, however strongly they were made, were broken under the pressure; and his endeavours were thus unsuccessful, until the happy idea suggested itself of operating in a vacuum. But it was extremely difficult, if not impossible, to introduce under the receiver of an air-pump an apparatus for compressing the powder of graphite. Mr. Brockedon overcame this difficulty by an arrangement as simple as it is easily executed, for after having compacted the graphite powder by moderate pressure, and thus reduced it to a certain size, he enclosed it in very thin paper, glued over the whole surface. He then pierced it in one place with a small round hole, permitting the escape of the air from within, when the block thus prepared was placed under an exhausted receiver, and the air having been removed, the orifice was closed with a small piece of paper, and in this state it was found that it might be left for 24 hours without injury. Being submitted then to a regulated pressure once more, the different particles became agglomerated, and a block of artificial graphite was produced by simple pressure, as

solid as the specimens obtained from the mine. From such blocks the exhibitor was able easily to obtain small prisms for use, which have yielded pencils equal in quality to those manufactured from the purest specimens from Snowdale.

The objects exhibited by Mr. Brockedon are as follows, viz. —

1. Specimens of graphite from Cumberland, India, Greenland, Spain, Bohemia, and several other localities.
2. Compressed powdered graphite.
3. The same powder in the form of artificial blocks, prepared in the manner just explained.
4. The graphite in small solid cylinders for Mordan's pencil-cases, and other specimens of pencils for various purposes, especially for drawing.

METHOD ADOPTED BY MR. H. L. PATTINSON, OF NEW-CASTLE-ON-TYNE, FOR SEPARATING SILVER FROM LEAD. (480, p. 166.)

Most of the ores of lead contain a small proportion of silver, which may be obtained from them by cupellation. This operation consists in oxidising the lead, and transforming it into litharge, during which the silver collects in the bed of the cupel, and remains unaltered; but it costs so much labour, and loss of lead, that it can only be applied economically when the lead contains at least 20 ounces of silver to the ton. By means of Mr. Pattinson's method, lead containing only 3 ounces of silver to the ton may be cupelled with profit. This important discovery in metallurgy, which dates back as far as 15 years, has been adopted during that period in various lead-works in England, and within the last three or four years has been introduced into Pique, Spain, and Prussia: it has, therefore, the sanction of experience, and its application has enabled some lead mines to be worked to profit which must otherwise have been neglected. The method is founded on the property which bodies possess to separate from each other during crystallisation, and become to a certain extent purer by its intervention. It consists in fusing the argentiferous lead in a large vessel, and when the fusion is complete, arranging the temperature to the point, so that the crystallisation of pure lead commences. The crystals of pure lead are then removed as soon as they are formed by a large iron ladle pierced with holes, and the silver is concentrated in a smaller portion of lead, becoming gradually more and more rich, until it is by successive operations brought to such a state that its further separation can be made with great advantage by cupellation.

The objects exhibited by Mr. Pattinson to illustrate the process, include—

1. A drawing, representing the whole of an establishment where the work is carried on. There are here seven adjacent pots, heated by the same furnace, in which the lead is brought to contain, by degrees, 14, 25, 5, 10, 20, 40, and even 70 to 75 ounces of silver per ton.
2. A large cake of silver obtained by cupellation from the enriched lead.

MANUFACTURE OF FINE SHEET-IRON, CALLED IRON PAPER, FROM THE WORKS OF THE BARON VON KLEIST, AT NEUDORF IN BOHEMIA. (Austria, 424, p. 1031.)

The BARON VON KLEIST has exhibited a series illustrating the various states of iron manufactured in his works at Neudorf in Bohemia. It consists of iron ores, pig-iron, and several specimens of iron in bar and in sheet, and tin-plate.

These products are all of excellent quality, but that which has chiefly attracted the attention of the Jury, and even of those who are most technically familiar with iron, is a particular kind of sheet-iron mentioned in the Catalogue as "Iron-paper," a name completely justified by the specimens. It is remarkable for its extreme thinness, flexibility, and strength, and is entirely without flaws.

According to Professor Tunner, the Austrian Member of the Jury, this material is used for making buttons, but is equally applicable for any objects that are stamped, and a high polish after being worked.

The sheet-iron, of which the method of manufac-

ture is not known to the Jury, and which is much superior to any in quality, is a very thin sheet of iron.

PRODUCTS OF THE VIEILLE MONTAGNE COMPANY, MANUFACTURED BY THE VIEILLE MONTAGNE COMPANY, (Belgium, 26, p. 1152.)

Thirty years ago, the means to which men were confined were very limited, and the operations of the Vieille Montagne Company have greatly assisted in extending them by the numerous applications of the metal which they have introduced: the earliest and most important of these resulted from a method of rolling sheet zinc, which at first presented considerable difficulties. Within the period the works of the Company have continued at the head of the same branch of zinc industry, having introduced successively into commerce, very flexible and thin sheets, zinc stamped for a variety of uses, including manufacture by drawing, nails and spikes of various kinds and all sizes, wire of great flexibility and of all numbers. They have recently employed zinc for castings of large size, and we may mention especially the statue exhibited of Her Majesty Queen Victoria, which, with the pedestal cast of the same material, presents a total height of 21 feet.

The Vieille Montagne Company has also applied the oxide of zinc to replace white lead in house painting, and for this purpose has recently opened two establishments for the manufacture of the white and grey zinc; one at Amies, near Paris, and the other at Valentin-Cou, near Liege. The works of this Society have continued to increase, notwithstanding the formation of several new Companies for working calamine and blende. At the present time it has 80 reducing furnaces at work, and employs 2640 workmen. The production in 1850 was 11,500 tons of zinc.

We may add, as justifying the high distinction awarded to the Vieille Montagne Company, that its zinc is of the best quality, and that the methods of working adopted differ essentially from those pursued in Silesia and England. The objects exhibited are very numerous, as well in the Belgian as in the French department, but it is not thought necessary to enumerate them after having indicated the uses to which this Company has applied it, we merely repeat that they are remarkable both for quality of material, and for excellence of workmanship.

PURIFYING APPARATUS OF M. BÉRARD, FOR SEPARATING FROM COAL ANY FOREIGN SUBSTANCES WHICH IT MAY CONTAIN, SUCH AS PYRITES OR SCHIST. (France, 51, p. 1173.)

The washing of coal, a system introduced into France within the last three or four years, is a branch of industry of the highest importance, permitting the use of coal which by its mixture with schist would not be otherwise employed. It may also be applied with advantage to certain coals, considered to be of good quality, but containing a quantity of ash which diminishes the value. They are purified by this method in such a way as to allow of the manufacture of a coke from these coals, not containing more than three or four per cent. of ash. The Great Northern Railway of France has recognised the efficiency of this method, and a considerable part of the coke which it consumes is manufactured of washed coal: these result from its employment a marked economy of fuel, and a greater durability of the locomotives.

The expenses of washing, which are considerable by the ordinary method, are reduced to ten or twelve centimes (about a penny) per-metrical ton of fuel by means of M. Bérard's method. A very important desideratum may, therefore, be considered as obtained.

The apparatus consists of three parts, viz. —

1. An elevator, formed of an endless chain with buckets,

\* These Exhibitors were also awarded a Commemorative Medal by the Jury of Class XXII. — I. W.  
† The metrical ton is equal to 1,000 kilograms, or nearly an English ton, and differs from the metrical quintal.

The process is carried out in a large tank, in which the coal is washed by means of a valve. This is composed of a long box, divided into three parts, and containing perforated plates, in stages, the size of the perforations being smaller and smaller by stages from the upper to the lower, so that by the shaking which this box undergoes, the coal is at once divided into four sizes. The finest powder falls to the bottom, and each of the three sizes of lumps being thrown out through openings in the sides of the box, into separate fixed sieves, called "bannes à lavage," which form the third part of the apparatus.

These "bannes à lavage" are long frames measuring 3 feet 3 inches by 4 feet, of which the bottoms are plaited with holes, the diameter of which is smaller than that of the pieces of coal thrown into them. They are entirely filled with water, and divided in the interior into three parts. In one of these is a piston which is worked up and down, and gives considerable motion to the water, which being communicated to the materials thrown on the bottom of the tank, these arrange themselves rapidly, in the order of their density, the heaviest being at the bottom. The pure coal alone comes to the surface, and by a current of water proceeding from a trough above, it is carried beyond the tank, and falls directly into the waggon, whence it is conveyed to its destination. The substances heavier than coal, such as schist, or pyrites, are deposited on the perforated bottom of the tank, which has a slight inclination towards a trap, and thus constantly advance towards an exit. By a peculiar arrangement, the rubbish is thus made to carry itself into a compartment prepared in the inside of the tank, whence it is removed by the mere opening of a valve.

It will be seen from this description, that the work is continuous throughout, and requires no manual labour. According to the declaration of M. Bérard, the quantity of coal that can be cleaned in an hour by a machine of this total cost of which would be 10,000 francs (4000 £), is ten to twelve metrical tons. The working of such a machine would not require more than about 2000 gallons of water per day (8 to 10 cubic metres).

The various specimens exhibited are as follows—

- 1 Coals cleaned in four sizes, and the foreign matters that have been separated from them.
- 2 Two specimens of coke, one made from coal as it comes from the mine and the other from "washed coal." The first contains 26 per cent of ash, the second only 2½ per cent.
- 3 A drawing of the apparatus.

The specimens are from an establishment founded by M. Bérard, at Molenbeck St. Jean, near Brussels. M. Bérard states that his apparatus has been adopted by the mining companies of the Loire, Creusot, Lymac, &c., in France, and that, at the present time, there is one being erected at Newcastle.

**VARIOUS OBJECTS IN BRASS, EXHIBITED BY MESSRS. ESTIVANT, BROTHERS, OF GIVAT (ARDENNES) (Tianc, 1214 p. 1235)**

The Messrs. ESTIVANT have forwarded a complete collection of their manufactures in brass, and the numerous objects which are included in it are all remarkable for admirable workmanship. We here mention only those which have attracted the attention of the Jury by their extraordinary dimensions, and difficulty of execution.

- 1 A sheet of rolled brass, measuring 15 feet 9 inches by 3 feet 7 inches, and less than a quarter of an inch (2.54 mm) in thickness, weighing 561 lbs.
- 2 A sheet measuring 81 inches by 49 inches, nearly 3 inches (76.2 mm) thick, weighing 1466 lbs.
- 3 A square bar of hammered brass, 8 feet long, and 4½ inches in diameter, weighing 580 lbs.
- 4 A square bar of rolled brass, 31 feet 7 inches in length, and 15 inches square at the section, weighing 350 lbs.
- 5 Two bars of hammered brass, each 7 feet 7 inches in length, and 15.75 inches high. The weight of the one is 1214 lbs., and of the other 1019 lbs.

6 A rolled sheet of Dutch metal (copper), measuring 65.75 inches by 25.55 inches, and weighing 7 lbs. 1½ ounces.

7 Brass wire of different sizes, one specimen less than the twentieth of an inch (1½ millimètres) in diameter, measuring 3691 yards in length, perfectly uniform throughout, and weighing 145 lbs 10 ozs.

8 A block of extremely fine Dutch leaf, very strong and very tough, and without flaws.

All these are objects of ordinary manufacture. The large pans are employed in dyeing, and in the manufacture of glue, the large bars are used in ship-building, the fine leaves are intended for plating and coating wood; the large rolled sheet has only been smoothed on one side, to show that the others are as they were run out, and the same is the case with the square bar, of which one end has been sawn. The dimensions of these specimens involve great difficulty of execution, both in first casting, and subsequently in manufacturing with regard to the former, Messrs. Estivant, although using nearly the ordinary proportions of copper and zinc for the brass, adopt special precautions to render the alloy homogeneous. All brass manufacturers are able to cast slabs of about a hundredweight and roll them into sheets weighing upwards of half that weight, but few of them are able to cast such masses as those exhibited here, without flaw, and roll them into sheets without flaws, even to the edges. This establishment therefore, completely fulfils the conditions imposed by the regulation, which requires for the Council Medal "excellence in known modes of obtaining, applying or adapting the raw material."

The annual work of Messrs. Estivant exceeds 1800 tons, and represents a value of about 80,000 £.

**SILVERATION OF GOLD FROM ARSENICAL PYRITES, BY W. GUTHRIE ACCORDING TO PLATTNER'S METHOD (Prussia, p. 1015)**

The mines of Leichensheim, in Silesia, abandoned for more than five centuries, have been recently opened with advantage, in consequence of the application on a large scale, of a method invented by Professor Plattner, for separating gold from the waste of arsenical ores.

The ore at Leichensheim is an arsenical pyrites, containing about 200 grains of gold in the ton. The ore is roasted in a reverberatory furnace, smelted by a large condenser, in which the arsenious acid is condensed. The first is it is volatilized. There then remains, on the floor of the furnace, oxide of iron mixed with a certain quantity of arsenic, together with the whole of the gold. This is placed in a vessel so arranged that a current of chlorine can be passed through it, by which the gold and iron are taken up, and afterwards separated from the residuum, by the aid of a certain quantity of water, and the gold is afterwards precipitated from this solution by sulphuretted hydrogen. To prevent the admixture of iron at this stage a small dose of hydrochloric acid is added to the solution before the sulphuretted hydrogen is introduced. The arsenious compound having been separated from the liquor is washed and heated in an open porcelain crucible, to drive off the sulphur, by which the gold is reduced to the metallic state by fusing it in the usual manner.

This simple and ingenious method, which has made it worth while to re-open the Leichensheim mine, is equally applicable to the vast quantity of refuse accumulated near many other old works. In awarding the Council Medal, the Jury have desired in this case to associate the name of Professor PLATTNER, the inventor of the method, with that of M. GUTHRIE, who has brought it into operation on a large scale.

**STEEL WORKS OF F. KRUPP, AT ESSEN, NEAR DUISBURG. (Prussia, 649 & 677, pp. 1060, 1067)**

This establishment which has been erected at great cost and heavy sacrifices by its founder, is distinguished for the superior quality of the cast steel made there, and yet more by the large dimensions of the objects produced. The Jury is not acquainted with the methods adopted by

M. Krupp for obtaining pieces of all dimensions, which appear, however, to differ in many respects from those prepared either in England or Germany. Of the objects exhibited the Jury have remarked a pair of cylinders for rolling steel; a rough cylinder, nearly four feet long, and weighing 4,300 lbs.; the axle of a railway carriage, weighing 100 lbs.; and a cylinder 15 inches in diameter, broken across the middle. The last magnificent specimen has chiefly attracted the attention of the Jury on account of the fineness and homogeneity of its grain throughout. The Exhibition does not show from any other country a bar of cast and forged steel of such large dimensions and of equal beauty. The members of the Jury do not remember to have seen anywhere a similar example.

M. Krupp has also exhibited cuirasses and carriage springs, to show both the strength and elasticity of his steel.

#### PRIZE MEDALS AND HONOURABLE MENTIONS.

Most of those who have obtained these medals, or who are honourably mentioned, have exhibited objects of ordinary manufacture, but of good workmanship. Concerning these it has been thought sufficient to prepare a very short notice; but we have given more extended details in the case of those who have introduced a new principle, or a new application of known principles; and we have also dwelt at some length on those objects which are instructive, and on collections from countries little known, their study offering a great interest in geological researches, and in the development of the industry connected with minerals. It is to be regretted that these collections are only accompanied by a few isolated notes, which give but very imperfect information as to the nature of the formations, and the position of the rocks which contain them.

We propose, as mentioned in the beginning of this Report, to enumerate those exhibitors who have obtained Medals or Honourable Mention, the respective countries to which they belong following in the same order as in the Official Catalogue of the Exhibition.

#### THE UNITED KINGDOM OF GREAT BRITAIN AND IRELAND.

Great Britain is the most favoured country in the world for the development of mineral industry. Fuel, the indispensable agent in the treatment of metalliferous ores, and the most powerful element in the production of motive force, is distributed unequally throughout the three countries of England, Scotland, and Ireland. The coal formation in these three divisions of the British empire occupies rich and widely-spread basins, several of which, especially those of Newcastle-on-Tyne, Scotland, and Wales, being situated near to the sea which surrounds the whole country, are enabled to export the coal to those places where the metalliferous ores exist in abundance, but where, as in Cornwall, the absence of fuel renders their being worked both difficult and costly. The ores of iron, abundantly distributed in several of the coal basins, add greatly to the value of these. Each one so circumstanced has become the centre of a metalliferous district, where numerous works produce iron at a price so moderate, that no nation can compete with this manufacture with any chance of success. The insular position of Great Britain, which allows the coal to be conveyed almost for nothing wherever it is wanted is equally important in enabling the iron to be conveyed by its ships throughout the world. These highly favourable conditions have given great development to the operations of coal mining and the manufacture of iron, and this has been especially felt since the application of cast iron for purposes of construction and the formation of the great lines of railroad.

The quantity of cast iron produced in England is as follows:—

|          |                 |
|----------|-----------------|
| In 1836. | 1,000,000 tons. |
| 1840     | 1,306,400 "     |
| 1844     | 1,816,000 "     |
| 1845     | 1,812,500 "     |

In the following years, owing to certain important local alterations, the trade received a great stimulus, and the make rose—

|         |    |                 |
|---------|----|-----------------|
| In 1848 | to | 1,998,000 tons. |
| 1849    | "  | 2,080,000 "     |
| 1850    | "  | 2,250,000 "     |

and in 1851 to an amount probably more than double the quantity made in 1844—seven years previously.

The quantity of coal raised in 1850 is not accurately known; but in 1850 it is estimated at 34,750,000 tons. The increase must have accompanied that of the make of iron, of which it is one of the most essential elements.

The average price of coal at the pit mouth in England is estimated at 5s. 7d., and that of pig iron at 48s. The produce of these two branches of industry amounts therefore to the annual value of upwards of 15,000,000*l.* viz:—

|  |             |
|--|-------------|
| 34,750,000 tons of coal at 5s. 7d. per ton | £9,701,070  |
| 2,250,000 tons of pig iron at 48s. "       | 6,800,000   |
|  | £16,501,070 |

Of this vast production about one-half of the iron and one-fourth part of the coal are exported to the colonies or to foreign countries.

These sources of wealth in coal and iron, which are alone sufficient to place a country at the head of mineral industry, are not the only ones possessed by England. Nature, liberal to profusion towards this favoured country, has given it mines of copper, of tin, and of lead, also of great richness. Perhaps some day a formidable competition may arise in the case of copper, by the working of enormous masses of native copper discovered on the shores of Lake Superior; but at present the Cornish mines furnish, as we have already remarked, two-thirds of the whole of the copper consumed throughout the world. With regard to tin, England divides with Saxony and the Indian Archipelago the monopoly of the trade in Europe.

The annual production of copper in Cornwall may be estimated at about 12,000 tons,\* the value of which amounts to upwards of 400,000*l.* sterling. The quantity of tin ore obtained annually may be estimated at 11,000 tons, the average yield of which is 65 per cent., or about 7,000 tons of metal. This, at 90*l.* per ton, would amount to 630,000*l.*

It is often supposed that England, so rich in regard to iron, copper, and tin, is comparatively poor in lead, or at least that the lead-mines are of secondary importance. This is an error arising from the fact that the production of lead, instead of being concentrated like that of copper in one or two districts, is spread over a great number of mines. Some, like those of Alston Moor in Cumberland, of Snailbitch in Shropshire, or of Wanlock in Dumfriesshire, are indeed well known, but most of the others are comparatively unknown. Their number notwithstanding is considerable, owing to the wide extent of palaeozoic rocks in Great Britain, and they raise the total of production in this metal to an amount which may perhaps place England also at the head of supply in this respect. Spain is at any rate the only country that can come into competition with her.

We were not fully aware of these results when the subject first came before us; but they have been communicated to us by Mr. Robert Hunt, who is well acquainted with the mineral industry of Great Britain. According to his statement it appears that the production of lead in England is distributed in the following manner among the principal metalliferous districts:—

|  | Ore.<br>Tons. | Lead.<br>Tons. |
|--|---------------|----------------|
| Cornwall and Devonshire                                  | 12,000        | 7,000          |
| Cumberland, Durham, Northumberland,<br>and Westmoreland. | 25,000        | 20,000         |
| Derbyshire, Shropshire, & Somersetshire                  | 10,000        | 6,776          |
| Yorkshire  | 7,000         | 2,000          |
| Wales  | 12,712        | 12,000         |
| Ireland  | 2,700         | 2,000          |
| Scotland   | 1,000         | 200            |
| Isle of Man  | 2,000         | 2,000          |
|  | 84,500        | 60,000         |

\* To this quantity must be added 6,000 tons of copper from foreign ores, 1851, the value of which is 240,000*l.*

In this statement of the value of the lead in England we have retained the account of the quantity of ore raised. The comparison of the two columns establishes the fact, that only 88 per cent. of metal is obtained after the mechanical preparations are completed, this being the average yield of the ores of lead in England, whilst, on the other hand, as much as 75 to 80 per cent. is obtained on the Continent. This difference in the yield of the ores is the result of the low price of fuel in England.

The brief account of the mineral wealth of Great Britain which we have here given previously to making known the results of the Exhibition, is sufficient to prove how great an interest the subject would possess if the statement could be made more complete. We greatly regret, on our own account that, for the reasons given in the commencement of this Report, so many persons have declined sending contributions to the Crystal Palace. In consequence of this there are many blanks which prevent our being able to form a satisfactory idea of the immense development of mineral industry in the British Islands and the existence of such blanks render it impossible to make a systematic classification of the objects exhibited which would be of great use in the statement we are about to make of the rewards decreed by the Jury. This difficulty induces us to describe in succession the several establishments which have obtained Medals and Honourable Mention. In each of these groups we shall compile the objects which offer the closest analogy.

#### PRIZE MEDALS

**COLLECTION OF ORES OF IRON, ILLUSTRATING THE GENERAL IRON-MAKING RESOURCES OF THE UNITED KINGDOM** (427, pp 150-159)

The production of iron in England, which was only 90,000 tons in 1750, suddenly increased to 180,000 tons on the important discovery by Mr Cort of the process of puddling with coal. It is now 2,250,000 tons. This vast production is distributed locally as follows:—South Wales and Monmouthshire 700,000 tons, Staffordshire and Shropshire 600,000, Scotland 600,000, and the remainder in different proportions among the other coal districts of England.

One of the chief causes of the development of the iron trade in England has been the occurrence of iron ores in layers amongst the coal measures, so that the ore and coal for smelting it are found in the same spot, while not unfrequently the coal measures also contain the refractory clay used in the construction of the smelting furnace, and the limestone needed as a flux occurs at no great distance.

Mr S BLACKWELL (427, p 150), in the interesting collection which he has exhibited, has placed this important fact in the strongest light. He has brought together the materials used in supplying each principal group of iron works, carefully indicating the exact localities whence these materials are obtained. We may thus see that the ores are not carried far, except when there is great facility of transport by canal or railroad.

The ores from the coal measures furnish, as has been just remarked, the larger part of those used in the iron works, but the resources of Great Britain are far from being limited to such ores, and Mr Blackwell's collection furnishes with respect to this matter very interesting facts, which we think it right to quote, and which the Jury fully considered in adjudicating to him a Prize Medal.

The carboniferous or mountain limestone of Lancashire, Cumberland, Durham, the Forest of Dean, Derbyshire, Somersetshire, and Wales, contains important veins of hematitic iron. This ore is worked in large quantities at Ulverston, Whitehaven, and the Forest of Dean. The brown hematite and carbonate of iron exist in large quantities in Alston Moor and Weardale, but these ores are not at present extensively worked. In the old rocks of Devonshire and Cornwall are found veins of hematite, of which a large quantity is exported to the coal districts of England, and especially to Newcastle-on-Tyne. The granite of Cornwall is rich in magnetic oxide of iron. The sandstone and the gneiss contain thick beds of argillaceous carbonate of iron, which are just now the object of extensive operations.

**COLUMN REPRESENTING A COMPLETE SECTION OF THE THICK COAL OF STAFFORDSHIRE.** (Outside 53, pp 116, 117.)

The coal formation of South Staffordshire and Dudley has a thickness of about 315 yards, and 11 beds of coal are known. That which occupies the sixth place in descending is designated as the "main coal," and is the principal object of working. It has a thickness of 10 yards 1 foot 6 inches, and is found near the town at a depth of about 120 yards. It is usually regarded as a single bed of coal, but really consists of 12 beds, separated by thin layers of schist called *partings*. The presence of these schistose portions, and the difference that can be traced in the quality and appearance of the coal, leaves no doubt about the matter. Messrs. BACWELL and JESSON, of West Bromwich, near Birmingham, have thought that it would be interesting to show the whole of this enormous thickness of coal, and have prepared a column of the total height in which the schistose partings are carefully preserved. In order to strengthen it in its position and preserve it from injury, the column has been placed in a large box with one side open, and covered with a shed, within which is placed a sectional drawing marking the name and the thickness of each seam, and the use to which the different varieties of coal are commonly applied. Considered as an object of instruction and information, the bringing together these different materials is a work of great interest.

#### COLLECTION OF TURQUOISES (20, p 122\*)

• In the year 1849, Major MACDONALD made a journey into Arabia Petrea, with the intention of studying the geology of the country, as well as those antiquities of whose existence he had convinced himself in a previous journey in 1843. In the course of his investigations he discovered in the country of Souhail six days' journey S. E. of Suez five or six localities in which turquoise existed, all included within a range of about forty miles. They are situated on the further side of a chain of mountains having an east and west direction, and having a mean elevation of five or six thousand feet.

Major Macdonald collected most of his specimens of turquoise from the ravines descending this chain, but he found some *in situ*. These latter are still attached to the parent rock, which is a reddish sandstone composed of quartz grains. It resembles in appearance the old red sandstone of Britain, and some schistose portions confirm us in the opinion that the rock belongs to the palaeozoic series.

The colour of the turquoise discovered by Major Macdonald differs in the shade of blue from that of the turquoise of Persia but agrees exactly with those brought from Abyssinia by M. Rochede Hérault. Both exhibit small globular concretions, whose hardness is equal to that of quartz. The nodules of turquoise form groups almost like currant-seeds in the sandstone. The intensity of the colour of alicent lumps is different, and when the groups are of tolerably large dimensions, zones of different tints may be observed. We have remarked in this fine collection of Major Macdonald—which contains more than 200 specimens cut and polished—one stone, *en cabochon* polished without cutting, divided into three zones in which the colour varies from an intense blue to a bluish-white.

This collection also presents besides the small concretions, veins of turquoise, from a tenth to a twentieth of an inch thick, which cut across the bedding of the sandstone like small threads.

Major Macdonald experienced many difficulties and great fatigue in his journey through the desert country. The temperature was often as high as 110° Fahr. Besides those forming his escort, he employed for some days more than 300 Bedouins in his mineralogical and geological researches, and in addition to the fine collection of turquoise, of which we have just given some details, he brought away several specimens of iron and copper ore, which, from their nature, support the opinion we have offered as to the age of these mountains of red sandstone.

The analogy of external character, in the case of

the turquoise from Arabia and Abyssinia is a remarkable fact. It would be interesting to compare the chemical composition of both with that of the Persian turquoise.

#### HONES, GRINDSTONES, AND POLISHING STONES. (84, p. 130.)

Mr. C. MANNING is the proprietor of one of the most important establishments in England for the preparation and sale of hones, grindstones, and polishing stones, and he obtains his materials from all parts of the world. We notice especially among the hones (oil stones) which he prepares, those of Turkey, Persia, the Arkansas, the banks of the Niagara, Spain, Peru, Ireland, and Wales. All these stones, notwithstanding the difference of locality whence they are obtained, possess very remarkable analogies. They are of a yellowish-white colour, fine-grained, and all appear to belong to altered argillaceous schists of the palæozoic period.

The grindstones offer greater variety than the hones, not only in the different localities whence the materials have been obtained, but in their respective uses. The establishment of Mr. Manning has exhibited more than 200 kinds of grindstones, varying in size from half an inch to 24 inches, and adapted to all purposes, from the cutting of diamonds to the sharpening of swords and bayonets. All of them are quartzose sandstones, of various degrees of fineness, according to the purposes for which they are intended.

#### SPECIMENS OF CORNISH PORPHYRIES. (141, p. 136.)

Mr. JAMES HENRY MERRITT, of Cornwall (141), has exhibited a collection of porphyry slabs remarkable for the beauty of their polish. They include—

1. A black porphyry slab, polished on both faces.
2. A red porphyry slab, also polished on both faces.
3. A green porphyry slab, polished on one face.
4. A porphyry table, in which are made six specimens of rocks, from the parish of Withiel, in the county of Cornwall.

These various slabs have been cut and polished in the granite-cutting works of Fowey Castle Mine, in the parish of Tywardreath. They are frequently used as paving-stones in the entrance-halls of large public buildings or private mansions. The mechanical contrivances used in polishing render the price very moderate.

#### COLLECTION OF ENGLISH GRANITES, MARBLES, AND BUILDING-STONES. (160, p. 137), AND CORNISH GRANITE OBELISK. (Outside, 14, p. 114.)

Messrs. W. and J. FREEMAN have exhibited a collection of granites and marbles, as remarkable for their varieties of colour as for the beauty of their polish; and the machines that they employ for cutting and polishing stones and marbles permitting them to supply them at a moderate price, it results that the slabs and paving-stones of granite and porphyry, which were formerly employed only in public edifices and but for decorative purposes, on account of their great cost, are now to be seen frequently in private houses and for purposes of utility. As an example of the power of the machines, which they employ in quarrying hard stones, Messrs. Freeman have exhibited an obelisk too large to be admitted into the interior of the Crystal Palace, and which is placed on the south side of the West facade. This obelisk is constructed of a large-grained granite from the Lanterna quarries, in Cornwall; its height is 22 feet 4 inches, and its weight 41 tons. It is placed on a pedestal of a other granite worked in the Carnaw quarry, weighing 31 tons. The working of blocks of granite large enough to furnish these two magnificent specimens offers difficulties so considerable, that the Jury have thought it right to mark their sense of them by awarding a Prize Medal to Messrs. Freeman.

This Exhibitor was awarded a Medal by the Jury of 1871, in whose Award his name appears.

This firm was awarded a Medal by the Jury of Class XVII., in whose Award his name appears.—L. W.

#### SLABS FROM THE FESTINOG QUARRIES, N. WALES. (210, p. 141.)

These slabs, which are of superior quality, are chiefly in use for covering buildings. They are also employed as walls for cisterns intended to hold water; but in this case large slabs are required. Several such slabs are exhibited some of which are more than 15 feet by 8 feet. Most of them are dressed to a rough polish, but one is in the state in which it came from the quarry. Dendritic markings may be observed on its surface. The Jury have awarded a Prize Medal to Mr. JOHN W. GRIFFITHS, who is the proprietor of the quarries at Festinog, and superintends the works.

#### METHOD OF CONDENSING THE SULPHUR FUMES PRODUCED IN THE REDUCTION OF LEAD ORES. (509, p. 176.)

From the chimneys of the roasting furnaces in lead works there escape sulphurous vapours injurious to the health of the workmen, and producing great destruction to the vegetation in the neighbourhood. To obviate this mischief, the Duke of Buccleuch has caused to be erected at his works at Wanlock, in Dumfriesshire, a large condenser, in which the deleterious vapours are collected. His Grace has exhibited a model of his furnaces and of the products obtained at his works.

The condenser, constructed about 100 yards from the smelting furnaces, consists of a solidly-built rectangular block of masonry, about 30 feet high. It is divided by a partition into two chambers, the first of which, the *condensing chamber*, receives the fumes from the furnaces directly through a large pipe; while the second, called the *exhausting chamber*, communicates with a very lofty chimney constructed in the form of a tower.

The condensing chamber is itself divided into two distinct compartments by a pair of vertical walls placed only two feet from each other, and forming a kind of flat pipe, open at the top, of the whole width of the chamber, and constantly receiving water falling in drops like rain. The water is thus broken into rain by passing through a filter of pounded coal placed in the upper part of the flat pipe at a height of six feet. Four horizontal partitions, or floors, divide the condensing chamber into five compartments, each six feet high, the last exactly corresponding to a bed of coal which forms a filter for the smoke, as the one already described does for the water. The smoke, at its entrance into the condensing chamber, is obliged, in order to reach the exhausting chamber, to pass in zig-zags across the five compartments, and then go through the bed of coal. The opening which conducts the smoke from the exhausting chamber into the chimney is placed in its lower part, so that the smoke has to pass through the whole of the exhausting chamber before reaching it, and in its course it meets an abundant shower of rain, which sweeps down all the insoluble portions which are deposited along the walls of the exhausting chamber.

To obtain this shower in a regular and uniform manner, the following contrivance has been adopted in the upper part of the chamber. The top is covered with a large iron lid, having twelve grooves about an inch wide, giving it the appearance of a gridiron. On this lid is a slide, having openings of the same size, and moving upon it so as to open or close the grooves in the lid, and a current of water being conducted from the upper part of the chamber, falls at intervals through the openings, and produces a copious shower in the empty chamber.

The atmospheric pressure acts on each movement of the slide with a force resembling that of the blast of an iron furnace, and produces an action sufficiently powerful to mix the impure vapours with the water, so that the smoke, at length passes into the atmosphere deprived of its injurious properties. The saturated water proceeding from these chambers is afterwards conducted into a reservoir, where it deposits the particles of lead with which the smoke had carried off.

#### MODELS OF THE FURNACES, &c., OF THE NEWCASTLE COMPANY. (412, p. 149.)

This Company makes use of the gases evolved from the smelting furnaces to supply a steam engine, and has exhibited a model (on the scale of 1/100) of the engine.

a part of their establishment, consisting of two furnaces. The gases conveyed from these furnaces between six and seven feet below the top are conducted into a small chamber, where they are mixed with hot air, and are thence conducted under the boilers of the steam-engine they are intended to feed. According to the statement of the exhibitors, no other fuel is needed for a sixty-horse engine; and they add, that the current of gas being regulated, the heat is uniform, and the boilers last much longer than when heated with coal, which they attribute to the absence of those irregularities of temperature produced when coal is used, and the doors of the furnace are constantly being opened and shut. The exhibitors have added to this model samples of the pig and other iron produced at their establishment: these are of very good quality.

**MODEL OF A CONTRIVANCE FOR OPENING AND SHUTTING 'AIR-REGULATING DOORS OF MINES' BY MEANS OF A SYSTEM OF LEVER.** (418, p. 150)

MR. HOSKETT MILLS has introduced into the coal mines of Foxhole, near Swansea, an arrangement of levers by which the doors connected with the ventilation of the mine are opened and closed by the main piston of the waggons through them. During 22 years that this method has been in use, there has not been a single explosion in the Foxhole mines. The Jury can discern, that this arrangement provides against the possibility of working, ensures good ventilation by keeping the doors regularly closed, and is an important improvement in practical mining, have awarded a Prize Medal to this exhibitor.

**SAFETY FUSES FOR MINING PURPOSES.** (424, p. 14)

The safety fuses here exhibited by Messrs. HICKS and SMITH, and DAVY, consist of a small thread of fine gunpowder twisted into the middle of a rope of which the strands have been separately tinned the whole rope being afterwards also tinned. The different kinds of safety fuse vary according to the coating employed to enable them to resist the pressure of water.

Safety fuses invented 15 or 16 years ago have been of great service, not only in a number of the accidents they have prevented, but in the facility with which they allow of shot being fired in mines, under water and in wet. They are lighted in the usual way and communicate with the charge after an interval determined by the length of the fuse. They are not injured by exposure to wet, and effect a saving in the quantity of powder required.

**ARRANGEMENT FOR CHANGING THE DIRECTION OF ROTATION IN MACHINERY.** (472, plate)

The model of stamping machinery applied to crushing copper and tin ores in Cornwall exhibits a peculiar method for reversing the direction of rotation, the invention of Mr. R. HOOKING to whom the Jury has adjudged a Prize Medal.

**OBELISKS OF COAL AND RHINDING STONE, &c.** (470, pp. 459-461)

The carboniferous system in Wales contains a very compact fine-grained grit, which furnishes an extremely solid freestone, resisting the action of fire. The Abercarn and Gwyther Collieries Company has exhibited an obelisk of this stone (Abercarn having the faces, differently worked, in order to show the grain of the stone and the manner in which it may be cut).

The same exhibitors send also the different varieties of coals from their locality, and the tools used in quarrying the Abercarn stone, as well as a description of the method adopted by them in deepening the shafts of mines. Several of the tools are of novel shape, and some appear to be well adapted for use. The mode of deepening shafts has attracted the attention of the Jury as reducing the cost of this operation. This double reason has induced them to award a Prize Medal to Mr. EBERHART ROGER, who represents the ABERCARN and GWYTHIR COMPANY.

**SEPARATION OF WOLFRAM FROM THE OXIDE OF TIN IN THE PREPARATION OF TIN ORES.** (485, p. 172)

MR. BENJAMIN OXLEY, of Plymouth, who has invented this method of separating wolfram from the oxide of tin, has exhibited a complete collection illustrating the successive operations of which it consists.

The wolfram ore having a specific gravity of 7 to 7½, and

therefore but little greater than oxide of tin, which is about 6.5, it is well-nigh impossible to separate the two minerals by washing, and all that can be done by the usual modes of mechanical preparation of tin ore is to bring them to a state in which they are mixed with wolfram only.

After determining by analysis the proportions they contain, a sufficient quantity of sulphate of soda is added to ensure an excess of soda relatively to the tungstic acid, and the whole is then mixed with charcoal dust to decompose the sulphuric acid, and pass the sulphate of soda into the state of sulphite. The mixture is placed in a reverberatory furnace, of which the bed is of cast iron, and is first exposed to a smoky or reducing flame, but afterwards to complete the operation it is necessary to have an oxidising flame.

The sulphate of soda being transformed into sulphide, the tungstic acid of iron is decomposed, and the tungstic acid combines with the soda, leaving the iron in the condition of a very fine powder. The tungstic acid of soda is afterwards dissolved out, and the oxide of tin separated from the oxide of iron by washing. The solution of tungstic acid of soda is evaporated, and the salt, obtained in a crystalline state is sold as a mordant for dyeing purposes, replacing with advantage the tungstic acid. The tungstic acid may also be obtained and the value of these products are sufficient to repay the cost of the process, at the same time using the value of the ore, so that a sample which had been only worth 42½ per cent was sufficiently improved to be worth 76. There is therefore, a great improvement in the preparation of the oxide of tin, for which a Prize Medal has been awarded by the Jury.

**COLLECTION ILLUSTRATING THE MANUFACTURE OF LEAD.** (494, p. 17)

MR. JOSHUA BIRGS proprietor of a lead mine in the county of Durham worked by himself, has exhibited a series of 14 products, which includes the lead ores as obtained from the Grass-hill Mine the ores prepared for smelting the lead in pot-stuck lead, and lead piping. There is also a cake or button of silver and the different qualities of litharge obtained during cupellation.

The signs which accompany the common and refined lead illustrate the successive conditions through which the ore has to pass in obtaining the various merchantable commodities.

**COLLECTION ILLUSTRATING THE IRON TRADE.** (411, pp. 145-149)

MESSRS. W. BIRD and Co. exhibit an extensive collection of specimens of iron illustrating the makes of different localities from the lowest priced "pig," manufactured from black iron by the use of the "hot-blast," to the more expensive made from the argillaceous ores by "cold blast." Also specimens of these severely decarbonized into refined metal and manufactured into the different descriptions of bar-iron in Staffordshire, Wales, and Scotland. The several stages of the manufacture are illustrated by slabs of railroad bars, boiler-plate, chain-cables, tin plates, zinc-plates, boiler-tubes, wire, &c. This collection gives a very correct and instructive explanation of the extent and variety of the iron manufacture of Great Britain, the descriptions exhibited being those of the sorts in every-day demand for home consumption and for export. It represents an annual make of not less than 500,000 tons.

A prominent part of the collection are two articles deserving of special notice: the one a round bar of iron, rolled at the works of John Bagnall and Sons, of West Bromwich, 20 feet 4 inches long, 7 inches in diameter, and weighing 2,644 lbs.; the other a cylindrical iron tube, 12 feet long and 7 inches in diameter, drawn by a patent process at the works of Selby and Johns, of Southwark. The Jury awarded a Prize Medal to Messrs. W. BIRD and Co. for their well-arranged and extensive collection, and to Messrs. J. BAGNALL and SONS and Messrs. SELBY and JOHNS, respectively, for the excellence of their productions.

**SPECIMENS OF SHEET IRON COATED WITH TIN, ZINC, WITH LEAD, &c., BY THE GALVANIC PROCESS.** (486, p. 161)

These specimens, exhibited by Messrs. Moxwood and

Recesses\* (patented), are good illustrations of the process peculiarly employed in their manufacture. The Jury being satisfied that the objects exhibited are of fine quality, and that some of them are difficult of execution, especially the sheets of galvanized tin-plate, which are of unusual size, measuring 8 feet by 3, have awarded them a Medal.

**SPECIMENS OF RARE METALS AND METALLIC COMPOUNDS.**  
(477, p. 166.)

Messrs. JOHNSON and MATTHEW, chemical manufacturers, have exhibited a complete collection illustrating the manufacture of platinum; consisting of crucibles, capsules, and a large pan of that metal. But that which has chiefly interested the Jury, and has induced them to grant a Prize Medal to these exhibitors, is the series of products, including palladium, iridium, rhodium, and uranium.

**SHEFFIELD STEEL.**

The steel of Sheffield has long enjoyed an European reputation. Almost every country is a tributary to its works; and notwithstanding that manufactures of steel have risen up in different parts of the Continent within the last twenty years, Sheffield has not ceased to develop its beautiful industry. Six firms have sent contributions to the Crystal Palace, and the Jury, after having made a careful examination, have decided to give a Medal to each of them; and notwithstanding that two have sent a more numerous and more neatly-arranged collection than the others, they are thus all placed on the same footing. These respective firms are—

JOHNSON, CAMMELL, and Co. of the Cylop Steel Works (XXII., 109, p. 605.)

COCKER, S. and SON, Portlet Steel Works (XXII., 115, p. 606.)

TURTON and SONS (XXII., 120, p. 614, and

EVNE, WARD, and Co.,† (XXII., 203, p. 615.)

The objects exhibited by these two firms represent the same manufactures.

BUTCHER, W. and S.† (XXII., 192, p. 614.)

NAYLOR, VICKERS, and Co. (XXII., 131, p. 615.)

These different manufacturers have exhibited various samples of steel in ingot and bar, and adapted for all purposes.

Two manufacturers, Messrs. JOHNSON, CAMMELL, and Co., and Messrs. Naylor and Co. (p. 605), have also exhibited models of their works. That of Messrs. JOHNSON is rather a general plan than a true model, but Messrs. Naylor (p. 615) have forwarded a model complete in all the furnaces, on a scale of an inch to a foot. It is furnished with much care; the furnaces are so contrived that they can be opened, thus showing their internal arrangement as well as their external form. The works of Messrs. Naylor contain eight converting furnaces, nine melting furnaces with 90 "holes," or 180 crucibles. They employ 150 workmen, and produce annually 2,300 tons of steel. This is about a sixteenth part of the whole quantity of steel made in Sheffield, which may be taken at 35,000 tons, of which 18,000 are cast steel.

Besides the instruction which the study of Messrs. Naylor's model is calculated to afford, the exhibition of their products is remarkable for an arrangement which admits of the different processes of steel making, from the cementation to the final production of bars in sale, being examined.

We must also mention, as amongst the objects exhibited by Sheffield, two ingots of steel which may be compared with the finest specimens exhibited by M. KRUPP, of Düsseldorf (649, p. 1066). One of these, from the establishment of Messrs. Cocker and Son (115, p. 606), weighs 6 cwt. 3 qrs. 1 lb. The other, called the monster ingot, weighs 2,688 lbs. It is 5 ft. 11 in. long, and nearly 14 in. in diameter, and was manufactured at Messrs. Turton's works. (190, p. 614.)

\* These Exhibitors receive a Medal in Class XXII., in whose Award List their names are inserted.—I. W.

† These Exhibitors receive Medals in Class XXI., in whose Award List their names are inserted.—I. W.

‡ These Exhibitors receive Medals in Class XXI., in whose Award List their names are inserted.—I. W.

**MANUFACTURE OF PIG AND BAR IRON. LOW MOOR IRON WORKS (XXII., 65, p. 601), AND BOWLING IRON COMPANY. (XXII., 83, p. 600.)**

The Jury has awarded a Medal to each of the establishments mentioned above, which have both exhibited their products, consisting of ores of iron, pig-iron, slags, coal, and bar-iron of different kinds, most of the specimens of the latter being bent and twisted, illustrative of the uses to which they may be applied, and of their respective qualities.

Although the Jury have placed these fine establishments together, it is only right to say that the exhibition of the Low Moor Works belonging to Messrs. Hird, Dawson, and Hardy (p. 601), is the more complete of the two. They have added to the raw materials and the iron, several objects manufactured in cast iron, especially a gun of very large calibre, solid and other shot, and cylinders or crushing rollers used in sugar mills.

**GALVANIZED IRON AND COPPER WIRE ROPE. (XXII., 30, p. 595.)**

Messrs. WILKINS and WEATHERLY have exhibited various samples of their manufacture of metal ropes and cables made according to Mr. Smith's patent. The Jury have recognised the excellent workmanship of these cables by awarding a Prize Medal to the manufacturer.

**(GAL. TRADE OF NORTHUMBRIA AND DURHAM. (274, pp. 146, 174.)**

The COMMITTEE of the Coal Trade of Newcastle-on-Tyne has exhibited several instructive documents on the geology of their district and the methods adopted in working the mines. These include

1. A map of the coal field of Durham and Northumberland, on which are marked the position of each shaft, the railways connected with each, the faults and other remarkable accidents which have disturbed or removed the beds.

2. Two sections of the field, one from north to south and the other from east to west, showing the relative position and thickness of all the beds.

3. A synopsis affording explanatory details of the map and sections.

4. A model, or relief plan of one of the principal mines in Northumberland, in which the mode of working and ventilating the mines of the district is indicated in detail.

5. Safety lamps used in the Durham and Northumberland mines, and models of apparatus employed in raising the coal to the pit mouth, and conveying it to the place of embarkation.

6. Lastly, a complete collection illustrating the coal formation, including all the varieties of coal found in this important field, the rock associated with them, and specimens of the vegetable markings. We have noticed in this splendid collection, containing 36 well-marked specimens of *Ulodendron majus* and *Ulodendron minus*, fossils extremely rare in many coal fields.

This collection affords, therefore, a most useful series for instruction by completely illustrating the most important coal field of England, which gives employment to 26,000 workmen, and annually supplies about eight millions of tons of coal.

**COLLECTION OF LEAD ORES AND LEAD MANUFACTURE. (484, pp. 168—172.)**

Mr. THOMAS SOPWITH, F.R.S., has exhibited a complete series illustrating the production of lead, consisting of ores from several mines in the north of England, and specimens showing the different mechanical preparations and smelting processes for obtaining merchantable lead. These specimens are placed in cases with the products obtained, so as to show at a single glance everything belonging to the establishment.

To render this collection more interesting, and really a means of instruction, Mr. Sopwith has added sections of

\* These Exhibitors were awarded a Prize Medal by the Jury of Class XXII., in whose List their names appear.—I. W.

the Allenshead mine in Northumberland, and of Alston Moor in Cumberland, while the faults and disturbances of the beds in the districts where these mines exist are represented in models which Mr Sopwith has had made after a method invented by himself.

The collection includes—

- 1 Sections of the strata at Allenshead and Alston Moor
- 2 Models to illustrate mineral veins, &c
- 3 Minerals associated with lead ores
- 4 Examples of the various stages of progress from the mine to the market
- 5 Lead and silver prepared for sale

This interesting collection illustrates almost completely the lead veins of the north of England and if similar collections existed of the copper and tin mines, those with Mr Blackwell's (p 150) fine collection of minerals, would form a complete series illustrating the chief metaliferous districts of England. This collection is highly interesting for the purposes of instruction and the Jury have awarded a Prize Medal to Mr Sopwith.

#### HONOURABLE MENTIONS

**GRINDSTONES FROM THE ARDLEY OAK QUARRY, NEAR HARVELEY (Oxford, 22 p 115)**

These grindstones exhibited by Mr James Hay on which all of excellent quality are chiefly in use in Lancashire and Yorkshire, where they are employed in cutting certain parts of machines and in grinding and sharpening tools. The sandstone of the quarries also furnishes a good building material.

#### BLACKS OF COAL FIRE

We mention here together the column and blocks of coal placed outside the Exhibition Building on the South Side of the Western End and numbered 44, 47, and 48, namely:

No 34, exhibited by Mr Edward Davies (p 11) from the Coed Taron Mynydd near Mold in Flintshire, North Wales.

No 41, exhibited by Mr Richard Barrow (p 116) of Stavley Works, near Chesterfield, Derbyshire. The block of coal, of which the weight is estimated at 24 tons, was extracted from a depth of 454 feet.

No 47 is a block of coal from the Baml Mynydd near Wrexham, North Wales, and is exhibited by the Fawcett Company, working the mines.

No 48 is a column intended to give a complete section of the thick coal of the Bunsley Works. The different nature of the coals here indicated especially those for steam engines, manufactures, and domestic use. This column, which is from the Elsecot Colliery, is exhibited by the HARRIS FIZWILLIAM.

#### COLLECTION OF MINERALOGICAL SPECIMENS AND Fossils FOR EDUCATIONAL PURPOSES (11)

Mr J TLYNANT has exhibited one tolerably complete collection of minerals, and several smaller collections to promote the study of mineralogy in colleges and for general educational purposes. The principal collection contains rather a large number of specimens remarkable for their fine state of preservation, and for the distinctness of the crystals, and is carefully arranged and catalogued. The small collection offer on a smaller scale the most common minerals, and those of which the knowledge is most useful for the study of geology, and its application to agriculture.

#### NATURAL AND ARTIFICIAL CRYSTALS OF SULPHUR AND THE EXTRACTION OF SULPHUR FROM ITS ORES (38 p 173.)

Mr. SAMUEL HOSKLEY, jun, has exhibited a series of specimens of native sulphur, and the ores (such as pyrites) from which this substance is generally obtained. He has added the different products obtained from the preparation of sulphur, and also some crystals of sulphur, prepared artificially in the following ways—

1. By fusion.
2. From solution in bisulphide of carbon
3. From solution in camphire at various temperatures from 170° to 260° Fahr.
4. From sulphur-pentachloride of phosphorus

These crystals, which correspond to the two forms obtained by M Mitscherlich, possess a true scientific interest.

#### COLLECTION OF GEMS (24, pp 122, 123.)

The owner of this magnificent collection, Mr H. F. TRISILLIHWAYTE, has chiefly had in view in its formation to exhibit the great variety of colours presented by each kind of gem, and the close resemblance of that found in stones of very different kinds, as in opalium, silicon, and spinelles.

The cut gems, to the number of upwards of 300, are accompanied by some crystals. We may mention particularly those of the diamond, which present a great variety of forms, and furnish very interesting materials for study to the mineralogist.

#### PHOSPHATE OF LIME, AS EMPLOYED FOR THE IMPROVEMENT OF SOILS (36, pp 124, 125 41 p 125)

It is now twenty years since that were discovered in the marls of the lias and in the lower beds of the cretaceous series nodules of phosphate of lime due in great part to coprolites. These nodules are tolerably plentiful in the fault of Surrey, and it has been attempted to make use of them both in the production of phosphorus, of which a large quantity is now consumed, and for agricultural purposes. It appears that the large proportion of bone phosphate which they contain reaching sometimes to 70 per cent produces a valuable manure. At the same time there are no sufficient data at present with regard to the cost of this substance which requires to be reduced to a fine powder in order to mix uniformly with the tillage soil to enable us to determine whether it can be regarded as an available source of improvement. Experiments on a sufficiently large scale have been undertaken within the last two or three years and the Jury wish to draw the attention to this important question, by making Honourable Mention of the following exhibit.

Mr JOHN M PAINE of Liphum (36, p 124) who has exhibited a variety of nodules containing phosphate of lime from the county of Surrey and samples of the same substance prepared for the market.

Mr J C NISBET of Kington (46 p 125), who has exhibited the phosphate in powder as used for manure.

#### STONEBRIDGE CLAY (91 pp 130, 131)

The Stonebridge clay obtained from the collieries is one of the richest fire clays which are distinguished by being employed almost entirely in the manufacture of bricks used in domestic buildings. In some cases of similar clays have been found in several of the English coal-fields, and Mr T. N. who has made a special study of the coal measures has observed that the beds in contact with the coal and especially those designated *blue band* generally yield rich fire clays. That of Stonebridge has thus a special importance but the facility with which it is worked makes it still very much sought after.

Messrs KIRK and CO (p 130) have exhibited specimens of the raw clay bricks and different objects manufactured of the clay and a model of a glass house, the interior of which is constructed of refractory bricks.

#### PORCELAIN AND POTTERY CLAYS FROM THE MOUTH WORKS PLIMPTON, DEVONSHIRE. (101 p 131)

These clays exhibited by Mr W PHILLIPS, are obtained from a large deposit recently opened up on an extensive scale a few miles from Plymouth and in the southern extremity of Dartmoor. The granite of Dartmoor is in some places decomposing and the china clay has been obtained as a Cornish, from a natural process of wash-

ing. Phosphatic nodules are found mixed up with the soil in Norfolk and Suffolk, in large beds irregularly distributed in the Red Crag one of the lowermost beds of the upper tertiary. They contain, on an average, about 65 per cent of phosphate of lime and are sold at the rate of 2s to 2s 1/2 per ton, being used extensively in the manufacture of artificial manures. In the lower greensand of Surrey they are also met with but their occurrence is neither in such large quantities, nor do they contain so regular a quantity of phosphate, which, consequently, render them of less commercial importance.

ing. The quality is extremely good; and there are exhibited with the raw material numerous objects in porcelain manufactured of it in Staffordshire.

**SAND EMPLOYED IN THE MANUFACTURE OF GLASS.**

(125, p. 133.)

The greensand formation at Stone, near Aylesbury, contains a tolerably thick deposit of loose sand, in the middle of which is a bed remarkable for its whiteness. It is composed of transparent quartz sand almost pure, and yields a very valuable material for the manufacture of crown and flint glass. Dr. Lee (125, p. 133) the proprietor of the pits, has exhibited specimens of the sand, besides prisms and two spheres of flint glass, in which the sand is an essential element, and whose beauty is a proof of the purity of the material.

**COLLECTION OF ORES OF TIN AND COPPER.** (168, 169, 173, pp. 165, 166.)

The LOCAL COMMITTEES OF TRURO, ST. JUSTELL, and SWANSEA have exhibited specimens of tin and copper ore from the principal Cornish mines, and have rendered the collections more complete by including the products obtained by the mechanical preparation and fusion of the ores.

The study of these collections will give an idea of all the operations which the ores of tin and copper undergo, from the time when they are detached by the miner from the parent rock to their actual metallurgical treatment. They thus afford considerable instruction to the student; and this has induced the Jury to grant them severally Honourable Mention.

In the first of these collections there may be observed an interesting object, consisting of an ingot of tin found by Mr. J. N. Simmons in the mines of Ladbroke, near Truro. Its presence in the old abandoned works have suggested the probability that this tin was cast by the Phœnicians at the time when they carried on a commercial intercourse with Cornwall.

**SPECIMENS OF LEAD ORE FROM SNATHATCH, NEAR SHREWSBURY.** (49, p. 13.)

We have given in the commencement of this Report (*ante*, p. 6) some details concerning the magnificent specimen obtained from these mines, and exhibited by Messrs. THOMAS, WILLIAM, and GEORGE BERN. We may add that its weight is no less than twelve hundredweight.

**ORES OF ZINC FROM ALSTON MOOR, CHIMBERLAND.** (50b, p. 17b.)

Mr. JOHN GREY has exhibited a series of ores of zinc from Alston Moor, including specimens of several varieties of calamine and blende. He has added samples of sheet zinc obtained by the treatment of these ores. The Jury has granted an Honourable Mention to Mr. Grey, on account of the good quality of the zinc, and some improvements in the method of obtaining it.

**PATENT FUEL COMPANY.** (230, p. 143.)

The patented invention known as "Wallich's Patent Fuel" has for its object the manufacture of bricks made with coal-dust, and thus affords the means of rendering available a material which is otherwise of very little value. These bricks measure 9 inches in length by 6½ and 5 inches, and weigh about 12 lbs. They are dense, give little smoke, and require a certain time for ignition. Those made with Welch coal, contain 90 per cent. of carbon, 6 per cent. of hydrogen, and 4 per cent. of ash. The specimens exhibited were made at Oxford, of coal from different localities, especially from Swansea and Middleborough-on-Tees.

**MODEL OF A COAL-MINE, WORKED BY THE HETTON**

**COMPANY AT NEWCASTLE.** (471, p. 161.)

Mr. J. WALLEN, of Newcastle, has exhibited a model, on the scale of an inch to a foot, of the machines placed above ground on level with one of the pits worked by the above Company, consisting of the steam-engine with its boilers, the lifting up, or tin, the waggon for conveying the coal, &c. The arrangement for loading the coal are also represented with accuracy. All parts of this model, even to the ropes, are executed with much fidelity and care.

**MECHANICAL PREPARATION OF THE VERY POOR ORES OF COPPER, CALLED "HALVANS." (434, p. 161.)**

Mr. RICHARD TAYLOR, Director of the Tyward-haile mines in Cornwall, belonging to H.R.H. the Prince of Wales, has introduced important modifications in the mechanical preparation of copper ores. These modifications, chiefly applicable to the poor ores called *halvans*, have rendered available certain ores hitherto regarded as worthless, and have even obtained from them a considerable per centage of metal. Mr. Taylor has exhibited a model of this mode of preparation, executed with much care; and to render it more complete he has added specimens of the ore in different stages, from the state in which it is brought from the mine to the ore ready for smelting.

It would be almost impossible without a plan to explain the details of an operation so complicated as the mechanical preparation of copper ores. We shall give a mere sketch.

The ore, after being picked by the hand, is submitted to a crushing mill, different in some respects from that generally made use of. It is then arranged in sizes, and washed on a very long table, where, in a series of sieves shaken by an oscillatory movement, a kind of horizontal broom turning on an axis lightly sweeps the surface of the ore, and removes the finer parts which are at the surface. The action of this broom united with that of the water, completes the cleansing of the ore; and this apparatus, which the Reporter had not before seen in any mining establishment, has a useful effect, and constitutes a marked improvement in the washing of copper ores. Mr. R. Taylor being a member of the Jury, cannot receive a Medal, as has been stated in the commencement of this Report, but the Jury have thought it right to make a special mention of his contrivance.

**APPARATUS FOR ADAPTING THE PISTONS OF PUMPS IN MINES.** (162, p. 165.)

Mr. J. ARTHUR has remarked, that often in mines the pumps do not produce all the effect required, in consequence of the wearing out of the pistons, thus occasioning a serious loss of power; and to remedy this inconvenience, he has proposed an arrangement which has for its object to force the leather furniture of the pistons to be in constant close contact with the body of the pump in which they work. According to the small model exhibited and referred to above, this arrangement consists of a copper cone fixed on the piston rod, and extending along its whole length. The piston is also provided inside with six or six iron rods arranged horizontally, and which slide on each other in the way of a latch. The pressure of the cone, which enters in close contact with the piston, acts on the rods and forces them out; these then press on the leather furniture and force it to take the exact form of the body of the pump. There can thus be no interval between the piston and the body of the pump, even if the latter has lost its true cylindrical shape by the action of corrosive waters, such as often exist in mines.

**PRODUCTION OF PIG AND BAR IRON AND STEEL.**

We insert under this title the Honourable Mention granted by the Jury to six establishments which are similarly circumstanced, and of which the products, all of excellent quality, are the result of ordinary methods. These are

The BUTTERLEY IRON COMPANY, of Alfreton, Derbyshire (400, p. 147).

CRUTWELL, ALLIEN, and Co., Blaith Iron Works, Aberystwyth (402, p. 147).

SOLLER and Co., Seabrook Iron and Steel Works, Tipton, Staffordshire (410, p. 148).

WING-SWORTH IRON COMPANY, Derbyshire (416, p. 150).

MONKLAND IRON and STEEL COMPANY, Lancashire (426, p. 150).

HILLCROFT, BUTLER, and Co., of Leeds (415, pp. 148, 149).

These establishments have combined with their products, consisting of pig iron, iron, and steel of different qualities, and various samples, the raw materials which they employ, as the ores of iron, coal, and flux.

The series of products exhibited by the Butterley and Monkland Works are more complete than the rest. The proprietors of the former have added a considerable number of fossil remains of plants from the coal-field to their collection, taking care to specify the different beds in which they are most frequently found.

CWM AVON WORKS, GLAMORGANSHIRE. (417, p. 150.)

Mr. JOHN BIDDULPH, manager of these works, has exhibited a series of specimens of pig and bar iron and tin-plate, which are of excellent workmanship. The tin-plate has specially attracted the attention of the Jury by the evenness of the tin coating, its lustre, and the quality of the sheet-iron which forms the basis.

IRON AND TIN-PLATE OF CARMARTHENSHIRE. (500, p. 174.)

Messrs. PHILLIPS, SMITH, and Co., of Llanelly, have exhibited a collection of tin plate, remarkable for the beauty of its manufacture. It is accompanied by sheet iron manufactured with wood fuel, and especially intended for this purpose.

COLLECTION OF ALLOYS. (48\*, p. 172.)

Mr. C. JORDAN, of Manchester, has exhibited a series of several metals, and the alloys that may be obtained by mixing them, viz., gold, silver, platinum, nickel, lead, copper, tin, zinc, bismuth, antimony, arsenic, cobalt, manganese, iridium, cadmium, and palladium. Each of these metals and its alloys is represented by a small button with polished faces, and even by broken specimens, to show the lustre and texture. For scientific and industrial purposes, this collection offers much interest.

A notice accompanying the collection states the composition of the different alloys made by Mr. Jordan, and the temperatures at which they are obtained.

REDUCTION OF ARSENIC. (488, p. 173.)

The ores of tin are mixed with rather a large proportion of arsenical pyrites. The arsenic is separated by a preparatory roasting, and deposited in the state of white oxide in the condensing chamber above the furnace. Mr. T. GARLAND, of Redruth, who has devoted himself to the manufacture of arsenic, has exhibited a series of specimens of his products. He has arranged them in such a way as to show the different processes employed for obtaining the pure oxide and metallic arsenic.

GEOLOGICAL COLLECTION OF THE BRISTOL BASIN. (23, p. 123.)

The Bristol basin offers examples of all the geological formations from the upper colite to the lower palaeozoic deposits belonging to the Silurian system. To give a real interest to his collection, Mr. T. HOWARD has accompanied it with a detailed geological map of the district, and with sections which show the position of the different beds and their relations with each other.

Ores of iron, zinc, and lead, and specimens of coal, complete this interesting collection; they are arranged according to the formation, so as to present the useful minerals peculiar to each geological group.

SECTIONS OF THE SCOTCH COAL-FIELDS. (220, p. 142.)

Mr. D. LANDALE has exhibited four sections of the Scotch coal-fields of Ayrshire, Lanarkshire, Mid-Lothian, and Fifeshire, respectively. These sections are not the result of direct observations, but they have been constructed by comparison of the different mines or natural sections observed along the coast, or in the numerous escarpments always existing in mountainous countries.

According to Mr. Landale's observations, the Mid-Lothian coal-field, in which Edinburgh is situated, contains 38 seams of coal, and the Fifeshire field 37.

These sections are the most complete that are known of the district. They illustrate the whole coal basin of Scotland, one of the largest and richest found in the British islands. They possess, therefore, much interest for the geological study of Scotland, and may in certain cases be referred to as affording a useful guide in working the coal.

We may state here once more that Ordinary Mention, or a special notice, has been given for productions of

good workmanship, but which have not attracted the attention of the Jury by any unquestionable superiority or novel process of manufacture.

However, not to lengthen out this Report unnecessarily, we shall simply mention the objects thus noticed:—

BLOCK OF SERPENTINE (p. 113), from the Lizard Rock, Cornwall. Exhibited by Mr. JOHN ORGAN, of Penzance (Outside, West, 1).

SLATES (p. 114). Exhibited by the OLD DELLADOLE SLATE COMPANY (Outside, 8), and by Mr. T. STIRLING, jun., of Lambeth (Outside, 9).

Specimen of ANTHRACITE (pp. 115, 116), weighing several hundredweights, from Cwmllyn-fell in the Swansea Valley, South Wales. Exhibited by Messrs. JAMES and AUBREY (Outside, 37).

Specimens of ANTHRACITIC COAL (p. 147), from Gwendraeth, Llanelly, South Wales. Exhibited by A. WATNEY (p. 276). This coal is entitled to notice, from the fact of its being the coal selected for the use of the boilers in the Machinery Department of the Exhibition.

MARBLE OF IRELAND. Exhibited by Mr. P. J. FRANKLIN (Outside, 28, p. 115), and Mr. MANDERSON (148, p. 136).

IRISH STONES employed in decorative sculpture. CORNICICES and other objects manufactured of them. Exhibited by Mr. J. C. E. LONG (73, p. 129).

PENNEK MARBLE, from the Woodyhide Quarries, used in decorative architecture. Exhibited by Mr. J. VOSS (135, p. 135).

Collection of BUILDING MATERIALS, from the county of SUSSEX. 152, p. 136.

PORPHYRY, described as ELVAN STONE, from the quarries of New Quay, in Cornwall. Exhibited by Mr. JOHN NICHOLS (162, p. 137).

Very fine CRYSTALS, in the veinstone. From the MUSO Mine, in NEW GUINAE. Exhibited by Mr. J. NELSON BONITTO (4, p. 120).

Collection of ORES OF COPPER, LEAD, and ARGENTIFEROUS LEAD, from various mines in PERTHSHIRE. Exhibited by the MARQUIS OF BREADALBANE (7, p. 120).

The specimens from the Tyndrum Mines are remarkable for their large size, and for the beauty of the crystals of galena, which form the principal mass. The Marquis of Breadalbane, the owner of these mines, has added to the ores, specimens containing rocks and various minerals that accompany them. This interesting collection offers, therefore, an almost complete history of the lead and copper veins of Perthshire.

Specimens of JET from WHITBY, in YORKSHIRE (11, p. 121).

The jet of Whitby, specimens of which are exhibited by Messrs. SLATER and WRIGHT, forms part of a thick bed of lignite found there in the upper lias marls. It differs in this respect, essentially from the jet worked in France and Spain, which is found in irregular veins in the lower marls of the cretaceous series corresponding with the gault of Sussex.

Collection from the SALT MINES of CHESHIRE, with the products, as purified. Exhibited by Mr. W. WORTHINGTON, of Northwich (97, p. 127).

Collection of different kinds of SOILS, from the neighbourhood of NEWBURY, in Berkshire (60, p. 127).

The town of Newbury is situated in a basin of lower tertiary beds reposing directly on the chalk. The nature of the soils is greatly varied by the mixture of London clay, plastic clay, and sand, associated together. The collection, exhibited by Mr. J. W. ROAKE, possesses an agricultural importance which is recognized by the Jury.

Collection of SANDS from CORNWALL, employed for building or agricultural purposes. Exhibited by Captain ROUSE and N. WHITLEY, Esq., of Truro (79, p. 130).

FINE and COARSE PORTELY CLAY, from the ISLE of PERRECK, in DORSETSHIRE (102, p. 132).

The English manufacturers in earthenware possess a high celebrity, which the Great Exhibition has brought into yet more prominent notice. A plastic clay is used in the manufacture, which forms thick beds in the small peninsula called Barbeck Island; Messrs. W. and J. PIRKS, the proprietors and workers of these pits, have exhibited samples of different qualities of the clays, especially those

adapted for fine earthenware, stone ware, and drainage pipes.

**Crucibles** for metallurgic purposes (118, p. 133), exhibited by S. ANSTEV.

These crucibles are employed by copper and brass-founders. Long experience has proved their excellence of manufacture, and the quality of the clay of which they are made.

**MATERIALS** used in the manufacture of POTTERY and GLASS, from the county of CORK; IRELAND (121, p. 133).

Mr. J. DREING, of Middleton, has exhibited a collection of clays from the Rostellan pits, of which he is the proprietor. These clays are employed, according to their quality, in the manufacture of porcelain, fine pottery, and terra cotta. Other materials found in the same place are much used in the manufacture of glass.

#### BRITISH COLONIES AND DEPENDENCIES.

The EAST INDIA COMPANY has exhibited a collection of minerals and rocks, consisting of about 450 specimens, most of them belonging to crystalline formations.

We have, however, noticed amongst these marbles, which have every appearance of being of the palaeozoic age, some specimens of tertiary rocks: there also exists coal of good quality.

It is to be regretted that the labels accompanying these specimens contain no information as to their relative position, while the names of the localities are for the most part absent from the common maps of India: so that great difficulties are in the way when we attempt to make out their geographical locality. It would be very desirable that the East India Company should entrust the arrangement of this collection to some one who knows the spots where the specimens were collected, as it would then become of great value for the study of the geology of this part of Asia.

With the exception of the tin ores of Malacca, and some sulphurates of antimony, and several specimens of ochre, also from Malacca, the various mineral products of India are not even indicated in the Official Catalogue; but the Jury have satisfied themselves that the collection contains several objects of much interest. They have noticed, especially the iron and steel of Salem, a district in the presidency of Madras, whence a carefully-selected series has been sent, including not only the ores, but the products obtained in the various stages of manufacture. The Jury have awarded a Prize Medal to the INDIAN IRON and STEEL COMPANY (pp. 860—869), for this collection, and have also awarded to the HONOURABLE EAST INDIA COMPANY (pp. 868, 869) Honourable Mentions for tin working (Singapore Committee), for specimens of coal, and for the treatment of antimony, the latter process being represented by specimens of the sulphuret of antimony, and of the antimony in the metallic state.

The collection that illustrates the methods of iron and steel working shows that two distinct operations are involved—the formation of blooms or lumps weighing at most 22 lbs., and the refining, or rather forging, these into flat bars from ten inches to a foot long. This iron is always steel-like, some bars being true steel. The work resembles that of the Catalonian forges, except that it is on so small a scale, and the process might be partly understood by considering the size of the blooms: but additional proof is obtained as to this mode of working, since we find in the Indian Collection a series of models, executed in the country, of a considerable number of industrial processes, amongst which is one of the forges of Salem. By looking at this model a sufficient idea may be obtained as to the nature of the iron manufacture.

The forges appear to be temporary establishments, capable of being conveyed about from one place to another. The hearth, hollowed out at the bottom, is round, and may be about 18 to 20 inches in diameter: it is surrounded by a rim of earth about six inches high, in which are the tuyeres, supplied by two pair of bellows of the shape of leathern bottles. The dimensions of the blooms lead us to suppose that only one is made at a time; the bars, which are placed on the walls of the hearth, and would be partly covered by the fuel, show that the forging is performed at the same time that the

bloom is obtained. Two blacksmiths, with a man to work the bellows, complete the number of those employed in one of these little establishments, and the forging is done entirely by hand. The ore, which is principally a metalloid form of the kind called oligist, is broken into small fragments, none of them larger than a walnut, and few larger than a hazel nut, before it is smelted.

The collection also includes buttons of cast-steel from 2 to 2½ inches in diameter; this material being the Wootz, so celebrated in India for the preparation of Damascus blades. There is nothing to show directly in what way they have been prepared, but it is impossible to doubt from their form that they have been obtained in small crucibles.

The specimens of tin ore are all water-worn pebbles, and it is therefore very probable that the mining operations in Malacca are confined to stream works. We may conclude that there are very extensive deposits of such ores in this part of India, since a large quantity of tin is exported.

The coal exhibited is from four localities, which belong to two distinct deposits. One of these is situated south of Mirzapoor, a dependency in the province of Benares, the seam cropping out in the valley of the Sone river, which empties itself into the Ganges a little above Patna; the other is in the valley of Damoodah, emptying itself into the Hoogly very near Calcutta. This latter coal, which is of very good quality, is in cubical lumps about 18 inches a side; the other, exhibited by Mr. HAMILTON (p. 861), belongs to a bed four feet thick, the position of which in the coal measures will be understood by the following section:—

|   | ft. in |
|---|--------|
| Vegetable earth and alluvium                          | 3 0    |
| Sandstone   | 35 0   |
| First bed of coal                                     | 0 9    |
| Clay, with vegetable markings                         | 1 6    |
| Argillaceous schist and clay                          | 4 6    |
| Second bed of coal                                    | 1 2    |
| Argillaceous schist, micaceous schisto sandstone, &c. | 20 0   |
| Third bed of coal (worked)                            | 4 0    |

Mr. Williams, who long occupied the post of geological surveyor to the East India Company, drew up a very interesting geological report on the valley of Damoodah, in which some details of the carboniferous basin of the valley are given.\* Of this deposit, which is likely soon to have an important influence on the industrial progress of India, we willingly give a short notice.

The coal basin of the valley of Damoodah is situated in longitude 84° E., and in latitude 24½° N. It commences a little west of the point where the Barakar flows into the Damoodah, and occupies a space of upwards of ten leagues along the valley. Towards the north it reaches as far as the river Adji, on whose banks the coal formation is seen outcropping for a distance of upwards of 25 miles. It is included between the towns of Nagore and Baucorah, the first to the north of the Adji, and the other to the south of the valley of Damoodah.

The coal measures rest on crystalline and metamorphic rocks, consisting of diorite, gneiss, and mica schist. In the hills to the north on which the actual contact is seen, there are also talcose schists with tourmaline, and schistose chlorites with magnetic iron ore. Towards the east the beds are covered up by a ferruginous sand, which is an extension of the alluvium of the plains of the Ganges.

Extensive researches have been made by the Bengal Coal Company, and by Messrs. Erskine and Co. The latter have explored chiefly in the neighbourhood of Buckennuggur and Mungulpore, and have made known the existence of five beds of coal having a total thickness of 22 feet, as seen in the following shaft-section of one of their pits:—

|   | ft. in. |
|---|---------|
| Whitish and brown fine-grained sandstone, composed of quartz, felspar, and mica | 11 0    |
| Schistose micaceous sandstone   | 2 0     |
| First bed.—Slaty coal, called <i>Top coal</i>                                   | 6 0     |

\* The report alluded to was written in 1847, by Mr. Williams, and published by direction of the Bengal Government after his death, which took place in 1848.

|   | ft. in. |
|---|---------|
| Black shale, very carbonaceous . . . . .                    | 0 4     |
| Second bed.—Coal of good quality. <i>Best coal.</i> . . . . | 8 4     |
| Black shale with vegetable impressions . . . . .            | 0 1     |
| Third bed of coal . . . . .                                 | 0 6     |
| Black carbonaceous shale . . . . .                          | 0 1     |
| Fourth bed.—Coal of fair quality. <i>Good</i> . . . . .     | 4 6     |
| Carbonaceous shale with vegetable impressions . . . . .     | 0 8     |
| Fifth bed of coal . . . . .                                 | 2 6     |

These beds have been reached in several other pits, but they seem to form only a part of the mineral riches of the basin, as the pits, opened half-way between Mummupore and Dassul by the Dhaba Company, have made known three other seams, one of which is 10 feet thick. But, more than this, a commission sent by the government to estimate the value of the Damoodah basin, with a view to the construction of a railway thence to Calcutta, has reported that there is a total thickness of at least 54 feet of workable coal, viz.:—

|                         |          |
|-------------------------|----------|
| Mungulpore . . . . .    | 20       |
| Khantagurreah . . . . . | 10       |
| Mummupore . . . . .     | 24       |
|                         | 54 feet. |

The island of CEYLON (p. 937) is represented in the Exhibition by a collection of minerals obtained for the most part from crystalline rocks. We may mention particularly the crystals of quartz, corundum, cymophane, zircon, tourmaline, and garnet. There may also be noticed magnetic iron ore, titaniferous iron ore, spathic ore (crystalline carbonate), and the ores of manganese.

The island of BORNEO (p. 988) has sent for exhibition coals from Labuan on the north-western side, besides some specimens of sulphur of antimony, and some pebbles of gold, and rolled diamonds.

\* The east and west shores of AUSTRALIA are not represented in this Class, and the ores of copper from South Australia are the only objects worthy of notice from the south side of that vast island. These are worked by several companies, one of which "the Burrossa Range Mining Company" (S. Australia 2, p. 991), has sent a series of beautiful specimens of oxide of copper, native copper, and carbonate, from Lynedoch valley, about 30 miles from Adelaide, a town whose origin dates only about 15 years back, but which has already a population of 8,000 inhabitants.

Messrs. GRAHAM and HALLETT (S. Australia 3, p. 991) exhibit a similar series of ores from the Barra-Barra mines, which have yielded 56,428 tons of ore, averaging 40 per cent. of copper between the time of their first opening in 1845 to the end of 1850, at which date more than 1,000 workmen were employed. At first these ores were smelted at Swansea, but the Company has lately constructed an establishment for reducing them on the spot, and the proprietors have added to their collection a view of this establishment, and specimens of the products obtained. The Jury have observed with interest the gradual development of this establishment in a spot till lately without any industrial occupation, and have awarded a Prize Medal to Messrs. GRAHAM and HALLETT, who have been the originators of it. They also wish to make Honourable Mention of the specimens exhibited by the BAROSSA RANGE MINING COMPANY.

The copper ores from Australia are strictly analogous to those from the Oural; they occur in nodules disseminated in a slightly coherent sandstone or ochrey clay, and the surface of the nodules is studded over with crystals, the interstices between which are filled with clay or sand. Some of the nodules are of large size; one of them in the Barra-Barra collection measuring 2½ feet by 2 feet superficial, with a thickness of 6 inches. In the specimen the principal mass consists of oxide of copper, with the green and blue carbonates of the same metal forming an external coating; but the three minerals are not superimposed in zones, the red oxide, although principally in the centre, sending out shoots in every direction. A little native copper also occurs with the oxide.

The reporter has observed with some surprise phosphate and chloride of copper among the specimens exhibited by the Barra-Barra Company (3, p. 991). These cuprifera combinations, which are chiefly found in Cornwall and Chili, usually occur in veins, which suggest the query

as to whether there are in Australia both kinds of copper ground, or whether these specimens are accidentally mixed. The labels do not enable us to reply to this query, which is of some geological interest.

VAN DIEMEN'S LAND appears to have been explored in some detail, Mr. J. MILLIGAN (p. 937) having exhibited a somewhat extensive series of rocks and minerals chiefly obtained from the east side of the island. Amongst these, and numbered 256 to 268, are several varieties of granite and metamorphic limestones, containing galena and coal, the latter mineral occurring in the river Douglas, associated with bands of carbonate of iron. We may also mention the beryls (white emerald), and yellow and orange-yellow topazes, exhibited by the same person (313 to 320, p. 988). The coal has been the object of research by a company called the Douglas River Coal Company (13, p. 993), who exhibit several specimens, showing that the fuel is compact and of good quality. The Jury have therefore awarded a Prize Medal to Mr. MILLIGAN, and they make Honourable Mention of the DOUGLAS RIVER COAL COMPANY.

NEW ZEALAND (p. 1000), like Van Diemen's Land, appears to have been the subject of a serious geological study. Eight persons have exhibited ores which are the result of their explorations, and some of the ores are already the object of practical workings. We may particularly refer to the coal of Waikato, and the copper mines of Kawaii.

The Jury have awarded an Ordinary Mention to the different exhibitors whose names we proceed to quote in the order of the Catalogue.

HARGREAVES, Mr. J. (8, p. 1001). Lignite worked on the banks of the Tamaki river, New Zealand. Judging from the specimens, this lignite exhibits a passage to cannel coal, and it is stated that the bed is 5 feet thick.

GREENWOOD, Mr. W. (9, p. 1001). Coal and building stone; the last-named are referred to in the Catalogue as No. 17.

CONNEL, Mr. (10, p. 1001). This exhibitor represents the Auckland and Waikato Coal Company (of which he is secretary), who have exhibited specimens of coal from the Waikato mines.

TAYLOR, Mr. J. (11, p. 1001). Geological series from the copper mines of Kawaii.

REVE, Mr. J. (12, p. 1001). Specimens of cuprifera pyrites and blue carbonate of copper, from the mines called Whitaker and Heale's near Kawaii.

LEWIS, Mr. T. (13, p. 1001). Specimens of copper ores from the mines called Great Barrier Island Mines, situated 35 miles N.N.E. of Auckland.

SMITH, Mr. J. A. (14, p. 1001). Specimens from Brodie's copper mines, situated 100 miles north of Auckland. The same exhibitor has also shown sulphur from White Island, in Plenty Bay; and samples of an argillaceous limestone, adapted for the manufacture of Roman cement (19, p. 1001).

MEURANQ, Mr. E. (15, p. 1001). Pumice-stone from the banks of the river Waikato.

\*The CAPE OF GOOD HOPE (p. 949) has sent fine specimens of galena, worked at the Maitland mines at Port St. Elizabeth. It also exhibits graphite from Cape Town, and iron ores from Uitenhage.

Of all the British colonies CANADA (p. 957) is that whose exhibition is the most interesting and the most complete; and one may even say that it is superior, so far as the mineral kingdom is concerned, to all countries that have forwarded their products to the Exhibition. This arises from the fact that the collection has been made in a systematic manner, and it results that the study of it furnishes the means of appreciating at once the geological structure and the mineral resources of Canada. It is to Mr. W. E. LOGAN, one of the members of the Jury, who fills the office of geological surveyor of Canada, that we are indebted for this collection; and its value arises from the fact, that he has selected on the spot most of the specimens that have been sent to the Exhibition, and has arranged them since their arrival in London. The arrangement that he has adopted, which is entirely technical, includes eight divisions, viz.:—

Metalliferous minerals, and metals obtained from them.

Minerals which require complicated operations to render them fit for use.

Lithographic limestones and minerals employed in jewellery, and in the manufacture of glass of various kinds.

Various kinds of clays, and refractory clays.

Rocks furnishing whetstones, hones, and polishing stones.

Rocks and minerals in use for improving soils.

Materials used in construction, and rocks serving for architectural decoration.

Combustible materials.

All these classes include materials of great interest for industrial purposes, and we think it useful to mention some more specially. The ores of iron require notice first of all for their abundance and excellent quality, as the magnetic oxide is worked in upwards of ten different localities.

The mines of Marmora, the most important of all, are situated in the west of Canada, and are worked in a mass of ore more than 100 feet thick. The magnetic ores obtained from them (4, p. 961) are accompanied by pig and bar iron from the works established on the spot, and belonging to the MARMORA IRON COMPANY. The Jury has recognised the good quality of their products by making Honourable Mention of this Company; and the same is awarded to Dr. J. WILSON (2, p. 961), who has exhibited magnetic iron ores from South Sherbrooke, and phosphate of lime from Burgess.

Ordinary Mention has also been made to Mr. LANCASTER of VAUDREUIL (6, p. 961), Captain MORIN of St. Vallier (9, p. 961), Messrs. L. SEER of St. Eustache (16, p. 961), E. CANON of St. Ann, Montmorency (19, p. 962), G. DUNSMUIR of Murray Bay (21, p. 962), and R. W. KELLY of Gaspé (22, p. 952), who have exhibited ores of iron of different kinds.

Massive hydrous oxide of iron is an important mineral amongst the iron ores of Canada, and is worked in large masses in several localities. We may mention, particularly, that of St. Maurice, which for more than half a century has supplied the iron works and foundries of that name. The Honourable J. FERRIER, the proprietor of the mines whose products are exhibited in No. 5, p. 951, has added to the ores specimens of pig and other iron, besides slags and ashes obtained during the working of the ores.

The iron from St. Maurice is of good quality, and the products exhibited show that this establishment proceeds with regularity, in a metallurgical point of view: these considerations have induced the Jury to award a Prize Medal to the proprietor.

The exhibition of Canada includes the ores of zinc, lead, and copper, from several localities. The ores of copper from Lake Superior and Lake Huron are remarkable for their richness, and that called 'Bruce Mine,' on Lake Huron, has been worked for some years. The MINING COMPANY of MONTREAL (the proprietors of this mine) have erected an establishment for working the ores on the spot, according to the methods adapted at Swansea, and the objects sent by this Company (10, p. 961), exhibit, by the side of the ores, the various products of smelting, besides the specimens of black and refined copper. Specimens of copper and native silver, from the Island of St. Ignace, on Lake Superior, are added to these, and the Jury has awarded to the Company a Prize Medal for these various objects.

The existence of spangles and pepites of gold has been proved, by actual investigation, in several rivers of the east of Canada, and Honourable Mention is made of the CHAUDRON MINING COMPANY (12, p. 961), who exhibit pepites of native gold collected in the washing those streams. Messrs. BOURGEOIS and LEBLANC (15, p. 961) are also rewarded with a Mention for the white quartzose sands which they exhibit, which are used with advantage in the manufacture of flint and crown glass.

The last award that we have to mention in the case of Canada, is the Honourable Mention adjudged to Mr. Logan (1, p. 958), who has exhibited iron ores, lithographic stones, minerals, and various rocks. Our colleague has not thought it right to add to these the geological map he has made of Canada, a matter which the Jury greatly

regret, not because they would then have been able to adjudge a higher reward for this beautiful work,—for the position of Mr. Logan, as member of the Jury, would render this impossible,—but because of the great interest it would have added to the Canada exhibition.

The lithographic stones exhibited by Mr. Logan (1, p. 958) belong to a palæozoic rock, occurring at Marmora, where the magnetic iron ore has been mentioned as forming a deposit of enormous thickness. These stones are remarkably homogeneous and fine grained; the degree of finish of the drawings that Mr. Logan has caused to be made upon them giving every promise of the quality being good. The geological position of the stones is interesting, and the reporter is not aware of such material having been previously found in the old rocks, since, up to the present time, those who practise lithography seek for stones from rocks of the oolitic series. The discovery of Mr. Logan, proving that the palæozoic rocks may also furnish good lithographic stones, increases the resources available for this important branch of engraving and drawing.

We must also notice, amongst the articles exhibited by Mr. Logan, a cast of the footprints of an animal discovered in one of the argillaceous schists of the palæozoic period. When this schist was first laid bare to a certain extent, Mr. Logan observed the impressions of footsteps repeated several times, and he had the upper bed removed to satisfy himself as to whether they were continued. Their existence, under these circumstances, fully proves that the markings were made at the time of deposit of the bed, and thus carries back the existence of quadrupedal animals to the earliest Silurian epoch. The length of the track discovered is eight feet, and as many as twenty impressions of each foot are traceable. Besides these is an impression between the footmarks, which may be regarded as the trail either of the abdomen or the tail of the animal.

It would carry us beyond the proper limits of this Report if we were to give even a sketch of the geology of Canada, and those who wish to become acquainted with the subject must be referred to the Report for the years 1848-49 and 1849-50, addressed by Mr. Logan to the Governor-General of Canada, and published by order of the Legislative Assembly of the colony. We must, however, mention the presence of phosphate of lime and gypsum; the former disseminated in large prismatic crystals in the metamorphic limestones occurring in thick beds at Burgess, while the gypsum is found in many localities forming large irregular masses, intercalated in the upper members of the Silurian series, especially at Oneida Seneca, on the Grand River. This gypsum has an even fracture, is foliaceous, and of a fine white colour, and being very pure, may be used for the manufacture of plaster for casting.

NEW BRUNSWICK and NOVA SCOTIA (pp. 969, 970), which are only separated from Canada by the River St. Lawrence, possess a similar geological structure, and the mineral productions are identical. The first of these colonies is only represented by some specimens of lignite and asphalt, recently discovered on the shores of the Peticodiac. There are, on the other hand, two rather interesting collections from Nova Scotia, one (8) exhibited by the Central Committee of the colony, the other by Mr. S. D. ARCHIBALD, F.R.S. (2, p. 970). The Jury has awarded a Prize Medal to the Committee, its collection including the whole geology of the colony, and offering a more general interest than that of Mr. Archibald. In the latter collection (2), the object has been to illustrate the resources of New Brunswick, with regard to the manufacture of iron and steel by means of charcoal fuel; and for this purpose Mr. Archibald has added to the specimens of magnetic and specular iron, which exist in thick masses, pig iron, wrought iron, and steel made from them, besides many manufactured objects worked at Sheffield, to prove the excellent quality of the iron and steel of the colony. The Jury has granted a Prize Medal to Mr. ARCHIBALD likewise.

In the collection of the Nova Scotia Committee, we may notice very good specimens of sulphates of barytes, ores of manganese, coal in large blocks, having all the

characteristics of bituminous coal, and ores of iron and copper. There are also blocks of bluish gypsum, of even fracture, and several basaltic minerals, especially stilbite, chabasite, apophyllite, heulandite, and mesotype.

The gypsum exists in several localities, grouped, for the most part, round the large inland bay called "Miffee Basin," which communicates with the Bay of Fundy by a small strait. Numerous quarries are opened where this gypsum is worked in the south of the Bay, near Falmouth, Windsor, and Cenept, and in the north in the county of Cumberland, near Tower Hill, the material being exported to the United States, where it is chiefly employed as a mineral manure. The gypsaceous masses in Nova Scotia, as in Canada, are intercalated in the palaeozoic rocks, and are chiefly found associated with beds of sandstone in this formation.

The coal appears to form two distinct basins, one at the northern extremity of the county of Cumberland, and on the slopes of Chignecto Bay, and the other in the Pictou district, near the town of Egerton. The latter is the best known, and most of the specimens in the Nova Scotia collection are from it. They are accompanied by numerous vegetable impressions, especially of *Lepidodendron elegans*, but there are also sigillaria more than two feet in diameter, one specimen of which is very remarkable, on account of the arrangement observable in the roots. This has been the subject of special description by Mr. Richard Brown,\* according to whose investigations it appears that this trunk of the sigillaria was erect, and penetrated several strata. This remarkable arrangement, quoted in support of that theory of the origin of coal which supposes it to be due to an accumulation of vegetable matter *in situ* is not, however, a solitary example, as Mr. Jackson, in his valuable work on Nova Scotia† says, "they are invariably found traversing one or more of the strata at right angles with its layers."

The ores of iron are in the state of magnetic oxide, red hematite, and oligist in compact masses. The hematite appears to form a considerable mass, in which the ore presents the various peculiarities common to concentrations; some are remarkable as containing crystals of aragonite in geodes occupying the centre, while in the same deposit sulphate of barytes occurs in tabular white crystals, connected at the base, and forming sometimes considerable masses. Occasionally, also, ores of manganese occur in radiated lumps, of a grey metallic appearance, without apparent crystals, the streak and other characters connecting the ores with pyroxisite.

Among the ores of iron we noticed particularly the massive oligist, which is studded with a multitude of fossils of spirifers, &c., and which is a palaeozoic deposit in this state. It is more than 16 feet thick, and quite continuous, as, according to Mr. Jackson, it is seen at the eastern extremity of the Pictou district, and ranges westwards as far as Annapolis; the specimens in the Exhibition, one of which is almost cubical, measuring 2 feet on each side, being from the latter place. In this deposit, so remarkable for its richness and extent (ranging for upwards of 100 miles), the ferruginous bed is not constantly traceable at the surface, having only been noticed from place to place at intervals, but the red colour of the soil, and the regularity of the stratification, render it highly probable that the bed of ore is continuous. It is intercalated among shales of the palaeozoic period, traversing Nova Scotia in a direction bearing N. 60° E., with a remarkable regularity. The dip, which is about 50° to 60° towards the north, is equally constant.

The ISLAND OF TRINIDAD is the last of the British Dependencies to be mentioned in this Report. The Governor, LORD HARRIS, has exhibited (1 to 35, p. 972) a series of useful minerals, which either have been the object of research or are now worked. They consist of ancient rocks, yielding good building material, and the following minerals, viz., magnetic iron ore, hematitic iron, yellow ochres, pyrites which exist in sufficient abundance to be employed in the manufacture of sulphur, and lastly bitumen. The

latter mineral is collected on the surface of a lake, around which are extinct and active volcanoes, and is represented by a collection of specimens of bitumen of various degrees of purity. The Jury has awarded an Honourable Mention to LORD HARRIS, as an acknowledgment of his interesting exhibition of the geology of Trinidad.

#### UNITED STATES OF AMERICA.

The geological works that have been published on the United States, among which must be mentioned as of the first importance the Reports addressed by several distinguished scientific men to different legislative assemblies of the Union, have satisfied us that this part of North America is destined to occupy an important place in the development of mineral industry.\*

It results from these Reports, that magnetic iron ore and specular iron ore or oligist occur in many states of the Union in an abundance not in any way inferior to that of Sweden. In America, also, as in Northern Europe, forests exist almost untouched, which will provide for centuries the fuel required to supply numerous iron-making establishments. The immense blocks of native copper discovered in the trap formations of Lake Superior, exhibit a degree of richness surpassing that of all known ores; and if the working of these remarkable deposits confirms the expectation raised by the investigations and researches carried on for some years under the direction of Mr. Jackson, Michigan will soon become one of the richest metalliferous districts in the world.

The exhibition from the United States does not, however, completely illustrate these sources of wealth, for we find them represented by only four iron-works, one manufactory of zinc, and some isolated specimens from iron mines in the states of Pennsylvania, New Jersey, Massachusetts, New York, and New Hampshire. We may add to these some fine blocks of anthracite from Pennsylvania, and the ores of copper from Lake Superior, one specimen of which weighs 2,544 lbs.

The iron exhibited by these different establishments is of excellent quality, and reminds one of the soft iron of Berry, and the iron so highly valued from Sweden. We regret not to have been able to procure any information, either as to the quantity of iron produced annually in these works, or the mode of manufacture. We know that the operations are carried on for the most part with charcoal fuel.†

The series exhibited by three of these establishments are nearly identical, and the Jury have not been able to distinguish any superiority between them. A Prize Medal has therefore been granted to each, viz.:

• Messrs. MORRIS, JONES, AND Co, Philadelphia, Pennsylvania (44, p. 1435).

• TRENTON IRON COMPANY, at Trenton, New Jersey (167, p. 1448).

• ADIRONDAC MANUFACTURING COMPANY, New York (344, p. 1456).

\* Those Reports include "Geology of the State of New York," by Mr. Hannous, Professor at Williams' College, and by Mr. Vanuxem, 3 vols. "Mineralogy of the same State by Mr. M'Beck, Professor of Chemistry at Rutgers' College, New Jersey," 1 vol. "Report of the Geology of Connecticut," by Mr. Shepherd. "Report on New Hampshire," by Mr. Jackson. "Report on the Geology of the State of Maine," by Mr. Jackson. "Geology of Nova Scotia," in 1 vol. 4to, by Mr. Jackson. "Report on the Copper Mines of Lake Superior," by Mr. Jackson. "Report on the Geological Constitution of Massachusetts," by Mr. Hitchcock.

† The annual make of iron in the United States is estimated at 400,000 tons. This quantity is the produce of about 298 furnaces, which are in constant operation, the low price of foreign (chiefly English) iron in the market having thrown several out of blast. Of these 298—

• 57 are anthracite furnaces, and make 56 tons each per week (average);

• 7 are bituminous coal furnaces, and make 22 tons each per week;

• 4 are coke furnaces, and make 48 tons each per week; 85 are charcoal furnaces (hot-blast), and make 21 tons each per week;

• 146 are charcoal furnaces (cold-blast), and make 14 tons each per week.

\* Quarterly Geol. Journal, for 1849, vol. v. page 539.

† "Mineralogy and Geology of Nova Scotia," by Charles T. Jackson and Francis Algon, page 70.

The objects exhibited consist of iron ore, slags, pig iron, and different specimens of iron. The Adirondac Company has also added manufactured iron and bars of steel, remarkable for the delicacy and evenness of the grain. The Trenton Iron Company has exhibited iron and iron wire of different numbers. One of these, of extreme delicacy, is also not less remarkable for the regularity with which it is drawn than for its great tenacity.

The exhibition from the iron works (202, p. 1450), belonging to Messrs. MORRELL, STEWART, and Co., of Cincinnati, in the state of Ohio, is less complete, containing neither ores nor pig iron, which makes it probable that this Company has not erected smelting furnaces. The sheet iron produced by them is of good quality, but the difference we have mentioned has induced the Jury to limit their acknowledgment to an Honourable Mention.

The ores which supply these several works consist chiefly of magnetic oxide, oligist, and spathic iron. The dimensions of the blocks of ore, and especially of the spathic iron, which are upwards of 20 inches a side, afford satisfactory proof of the riches of the deposit; and with regard to some particular localities, we have descriptions which seem to show the presence of ores even on a larger scale than in Sweden and Elba, and where the magnetic oxide and oligist appear to have been erupted.

According to the description of Mr. Enmons,\* the mass of magnetic ore which supplies the works at Adirondac is the most remarkable of all for its thickness and extent. It would seem to occupy, at the height of Lake Henderson, the whole of the valley of Adirondac for more than 15 miles in length, reappearing on the shores of Lake Sandford, and having a range of more than eight miles. In each of these localities there is a band of magnetic iron ore more than a mile wide, not stratified, but forming three distinct veins, manifested by differences of grain, and even by the quality of the iron made from each, without the chemical composition indicating any distinction. Often these veins are cut by others of a different kind; just as we sometimes see veins of large-grained granite penetrating masses of fine-grained rock of the same kind.

It is an interesting fact, and one we feel it right to mention, because it may to a certain extent throw light on the causes which determine ores of a similar nature to yield iron of various qualities, that in the Adirondac mines, a contact with trap rock is observable. Mr. Enmons states that, "when the mass of ore is intersected by a trap dyke, its appearance is more crystalline, the reduction of the ore is a slower operation, and the iron obtained is hard and difficult to work."

A Prize Medal is also given to the NEW JERSEY EXPLORING AND MINING COMPANY, the seat of whose operations is at Newark in New Jersey, and which has exhibited (166, p. 1447) zinc obtained from "franklinite," and some fine crystals of this mineral. The composition of franklinite, which is oxide of zinc combined with oxide of manganese, probably requires a different treatment from that pursued in Belgium, Silesia, and England, to obtain metallic zinc. We should have been glad to learn the nature of the difference, but were not able to obtain any information on the subject, neither were we able to obtain a specimen of it, which we wished to possess in order to repeat the analysis made by M. Berthier on specimens mixed with magnetic iron ore and veinstone.

Honourable Mention has been awarded to seven exhibitors, whom we shall mention in the order of their insertion in the Catalogue.

Mr. C. W. PALLE, of Hicksherville, in Pennsylvania (74, p. 1438), for very fine specimens of anthracite, and the accompanying rocks. These specimens agree with an interesting description given of the mines of Pennsylvania, and place this fuel among the carboniferous series.

Mr. W. DARLING, of Reading, in Pennsylvania (191, p. 1449), for iron ores and metallic iron.

Mr. A. J. ROUSSEAU, of Troy, New York (314, p. 1454), for iron ores.

Mr. W. LEE, New York (322, p. 1456), for spathic iron ore, each specimen measuring upwards of a foot every way. This ore contains a little manganese, and passes into the state of hydrous oxide on decomposition. It forms a vein of great thickness, and has been followed to a considerable distance.

Messrs. W. and J. W. WARR, of Boston, Massachusetts (408, p. 1462), for specimens of copper ore.

Mr. G. H. RUGGLES, also of Boston (416, p. 1462), for sheets of mica of very large size, used for the doors of stoves, as being transparent and allowing the fire to be seen through them. The construction of the stoves is such, that the heat, which is probably carried to the back of the fire, does not attack the mica, and it often lasts several years.

Dr. FAUCHTWAENDER (469, p. 1464), of New York, for a collection of minerals, fossils, and fresh-water shells, collected in America. In this large series of specimens, which are in rather a bad state of preservation, perhaps occasioned by their transport to Europe, there are several rare minerals, especially zoofites from trap-vein rocks. There are also crystalline diamonds, some fine topazes, and specimens of native copper and silver. The mass of native copper from Lake Superior, mentioned at the beginning of this account of the United States products, and weighing 2,544 lbs., belongs to this Exhibitor, and bears marks of the chisel which prove it to have been part of a still larger piece. It will be seen, indeed, from the brief notice here subjoined on the deposit of native copper in Lake Superior and the Isle Royale, that masses have been extracted whose weight exceeds 10 tons.

#### *Deposit of Copper on the Shores of Lake Superior.*

The peculiar nature of the deposit of copper in the state of Michigan, and the influence that this discovery may have on the production of that metal, have induced the Reporter to give some details on this important fact in relation to the mineral industry of the United States. They are extracted from the interesting Report published by Mr. Jackson,\* on the researches that have been instituted to make known the circumstances of this deposit, and the well-founded expectations to which it gives rise.

We must first remind the reader, that the discovery of copper on the shores of Lake Superior is not so recent as is generally imagined, as it dates from very shortly after the establishment of the French in Canada; and if at that period it led to no results, the reason was that the country being then occupied exclusively by the Indians, was little accessible to the colonists, while, as far as the Indians themselves were concerned, very ancient superstitions prevented them from making any long stay at Keweenaw Point, where the existence of the native copper was first determined.

The antiquity of this discovery is attested in a work published in Paris in 1636, by M. Logarde, who states that M. Truchemont Bruslé had given him an ingot of copper, obtained 100 leagues west of Lake Huron. A second notice of the existence of a mass of copper in this part of America is given in the account published in 1666, by Father Claude Allouez, of the Mission of the Holy Ghost at Outaouacs, in Lake Tracy or Superior. He there states (chap. ii., p. 32), that copper exists in abundance on the south shores of this lake, at 50 or 60 leagues beyond the Leap of St. Mary, on the other side of the place called Missipiconatong.

It is clear from later publications, that the trace of this discovery was never lost, and several travellers, amongst whom may be mentioned General Cass, have personally verified its correctness. But the first scientific researches commenced only in 1842, and were made by Dr. Douglass Houghton, attached to the government of the state of Michigan as geological surveyor, but who died on the coast at Keweenaw Point before his observations were published. The details that we have at present concerning the deposit are due to Mr. Jackson, who has made a detailed study of the district.

According to the description given by this distinguished geologist, the native copper exists on the shores of Lake

\* "Geology of New York," Part II., by Mr. Emmons, Professor of Natural History, at Williams College, p. 246.

\* "Geological and Mineralogical Reports," by Mr. Charles Jackson, November 1849.

Superior in two distinct deposits, one towards the northern extremity of the state of Michigan at Keweenaw Point, which forms a projecting headland towards the middle of the south shore of Lake Superior, and the other in Isle Royale, situated in the lake, about 50 miles north of Keweenaw Point. This island, which ranges north-east and south-west, lies exactly parallel to Cape Keweenaw, and to the strike of the beds of which it is composed. It presents also a geological construction identical with that of the shores of the lake. The two deposits occur in the same formation, and under circumstances precisely similar.

Mr. Jackson's geological map shows that the Michigan shore of the lake consists of granite, trappean rock, and red sandstone belonging to the lower Silurian series. The trap, like that of Scotland, is composed, according to Mr. Jackson, of an aggregate of crystals of hornblende and feldspar, mingled with crystals of magnetic iron ore. There are also found, occasionally, prenite, datolite, laumontite, chlorite, and laminated calc-spar.

The sandstone and trap form parallel bands, running due north-east and south-west. At Cape Keweenaw the sandstone is seen to the right, and the trap to the left. At Isle Royale the south shore is the only one on which the sandstone can be traced, so that from this arrangement the trap would seem to form two parallel bands. The separation of the sandstone and trap is marked by a conglomerate, called by Mr. Jackson, trap-tuff, which consists of fragments of sandstone, compact trap, melted trap, amygdaloid, and sometimes pebbles of old rocks. In many localities, especially at Eagle River, this conglomerate is of considerable thickness, and has been falsely regarded as belonging to the palæozoic epoch. Near the junction the trap is amygdaloidal, and seems to have undergone a certain modification of texture at its contact with the sandstone. The cavities are filled with chlorite, agates, laumontite, pectolite, and laminated calc-spar, in small concretionary nodules, the size of which varies from that of a grain of millet to a musket-ball. The surface of the included calc-spar and agate is covered by a film of chlorite, so that when first removed they look like small nodules of chlorite, and their true nature can only be determined by breaking them. It has been noticed in the course of the operations carried on by the Lake Superior Company, that when the cavities were filled with chlorite nodules, there was always a grain of copper in the centre. Elsewhere, and near the veins of copper, the included minerals in the same amygdaloid were occupied by copper or native silver, or by these two metals at once.

Native copper and silver are found at Cape Keweenaw and Isle Royale only in the trap formation, all the important veins forming together a narrow zone in the amygdaloid. When a vein of copper penetrates the trap it at once thins out, and only affords a thin film not worth working. The sandstone and conglomerate form also another limit of the metalliferous band, and when the veins do not terminate at the contact of the sandstone, the part extending into this rock is filled with calc-spar instead of copper. It hence results that the thickness of the amygdaloidal band intervening between the trap itself and the sandstone becomes the limit of the cupriferous veins, and this thickness rarely exceeds 2,000 feet. The depth of the veins is unknown, but Mr. Jackson imagines that they extend below the sandstone.

At Keweenaw Point the cupriferous zone may be about 120 miles in length; and in Isle Royale it ranges through the whole extent of the island, which is about 45 miles long. The richer portions are unequally distributed; and Mr. Jackson states that his numerous researches, extending over several years, have made known to him almost all the places where workings may be carried on with advantage.

The trap forming a band in the middle of the sandstone, there occur, of course, two amygdaloidal zones at the contact of the rocks. A marked difference is always observed on the two sides, both in the quantity of copper and the state in which it is presented. The difference may, however, have reference to the nature of the trap. Metallic copper is chiefly found in the north zone at

Keweenaw Point, while in the south the copper is in a state of sulphuret. The trap here is a porphyry, consisting of a compact felspathic base with crystals of felspar. On the small lake called "La Belle Mine" (near the extremity of Keweenaw Point, and which belongs to the southern zone), the trap rock is very crystalline, and resembles syenite.

We will not follow Mr. Jackson in relating the details of the veins, of which he has explored upwards of a hundred, merely stating that these veins are generally transverse to the amygdaloidal band. In Copper-fall's mine they take a direction from N. 25° W. to N. 30° W. and S. 25° to 30° E., almost at right angles to the line of separation of the trap and sandstone, and the dip is here, 70° W. These veins are 18 inches wide, of which metallic copper occupies at least a fourth part. Mr. Jackson states that he has seen a mass 20 feet long, 9 feet wide, and from 4 to 6 inches thick taken from these mines. The mass weighed about 10 tons.

These masses of large dimensions are not rare, and to give an idea of the richness of the mines and the expense of working them, Mr. Jackson states in a Report, dated 26th September, 1848, "that the produce of the mines for one year had been nearly 43 tons (95,994 lbs.) of ore, containing 70 per cent. of metal, or about 30 tons of copper in all. This produce was the result of the labour of 38 men, of whom 20 were miners and the rest labourers. Among the masses of copper obtained from these mines, he mentions four whose respective weights were 7,018, 7,484, 7,678, and 14,000 lbs.

#### AUSTRIA.

The Exhibition affords but a very imperfect view of the mineral resources and mineral industry of Austria; for the working of mines is really very actively carried on in the different states of this vast empire. The difficulties we have referred to at the commencement of this Report, and which have prevented so many persons from taking a part in the Exhibition, have been especially felt in a country whose territory reaches the sea in only a few points, and whose average distance from London is upwards of 500 leagues. It thus happens that the numerous industrial occupations carried on in Austria, and referred to the consideration of this Jury, are represented by only 60 exhibitors, 30 of whom are occupied exclusively in the production of iron and steel. Of this number again, Carinthia, Styria, and Upper and Lower Austria, have furnished two-thirds, and the mines of copper, mercury, cobalt, and nickel in Hungary, those of pyrites in Bohemia, and of arsenic in Salzburg, complete the list. Among the objects missing, and of which the absence is most to be regretted, must be mentioned the various methods of mechanical preparation so well understood in Germany. These would have been especially instructive: for at the present time, when mines formerly abandoned as yielding ores too poor to pay for working are being re-opened in order to draw from their rubbish those valuable portions neglected by the ancients, it is much more by improvement in mechanical preparation that economy can be introduced into these difficult operations, than by any metallurgical processes which have long since been carried to a high degree of perfection.

In order to give some interest to the enumeration of the establishments who have obtained Medals or Honourable Mention, as well as to indicate their relative positions, we here give a rapid notice of the principal sources of mineral wealth in Austria.

Almost all the states of the Empire possess important deposits of iron ore, and the abundance of wood has rendered it possible to introduce everywhere numerous establishments for working these ores. Styria, Carinthia, and Lower Austria are the most important districts, and deserve special mention on account of the abundance and quality of the ores as well as for the peculiar methods of manufacture adopted there.

The most common of the ores of iron is the sparry carbonate (apatitic iron), which forms very thick beds, intercalated amongst the gneiss and Alpine limestone on the north and south flanks of the axis of the Alps. Of these in the northern district we may mention the dis-

at Erzberg, near Eisenerz, in Styria, which has been celebrated for many centuries, and which has furnished upwards of two millions of *measures*\* equivalent to 110,000 tons of excellent ore, smelted in the works of Hieslan, Eisenerz, and Vorderberg. Other deposits, not far off, supply the adjacent works of Neuberg, Mariazell, &c. On the southern side of the central chain the deposits of spathic iron are equally abundant, and furnish ores to the works in Carinthia, of which we may mention Lölling, Hüttenberg, and Wolfsberg.

The brown hematites, without being so abundant as the spathic ores, perform a very important part in the production of iron in Austria, and chiefly in the southern districts. In Carinthia they occupy veins and form beds in the granwacke, and in the micaceous schists.

The hydrous oxide of iron, which is a third ore worked abundantly in this country, exists in more modern formations, or at least in rocks which have been less altered, and have not been subjected to metamorphic action. The principal establishments in the south of Austria are supplied from this ore.

The spathic ores and hematites are well adapted for the manufacture of steel and strong iron. They occur in calcareous or quartz veins, and the only injurious substances found with them consist of a small quantity of metallic sulphurets, chiefly copper pyrites disseminated in patches amongst the spathic iron. The presence of these sulphurets requires sometimes a careful picking to separate the fragments in which they are most abundant, and also exposure to atmospheric action, by which they are decomposed. The spathic ores are, however, always roasted before being smelted, partly in order to get rid of any sulphur that they may contain, although the chief object of this operation is to decompose the carbonates, and thus render the ore more porous and more easily reduced.

The rapidity with which these ores are smelted is ultimately so great, that more than 20 tons of pig per day are obtained from the furnaces at Lölling with an unusually small consumption of charcoal, the proportion being indeed less than one part of charcoal for one of pig; the result in one case ranging as low as 0·83 charcoal for 1<sup>ton</sup> of pig.

In Styria are still used occasionally the small Styrian forges; but the principal establishments have adopted reverberatory furnaces for puddling, forging, and other purposes in iron-working. The employment of these reverberatory furnaces is interesting on account of the different kinds of fuel consumed in them: thus at Schlegelmühle, near Gloggnitz, they use gases produced in a special apparatus; at Neuberg and Wolfsberg, wood, either simply air-dried or baked in ovens, is employed; at Mentern, near Loeben in Styria, air-dried turf; and at Prevaly, in Carinthia, lignite.

In the further processes of iron-making, and especially in the manufacture of sheet-iron, the use of turf is common in the Styrian works. We may especially refer to those of the valley of Mürz, where we have had the opportunity of observing the operation.

The refining for steel is performed in small Styrian hearths, and the steel thus obtained is of excellent quality. It is indeed only necessary to refer to the Styrian scythes, whose reputation extends over the whole world, as sufficient proof of the excellence of this material.

Iron and steel are by no means the only sources of mineral wealth possessed by Austria. In Carinthia, and especially at Raibl and Heiberg, are mines of lead greatly valued for the remarkable purity of the metal. Hungary, Transylvania, the Banat, and Bohemia, also possess important mines of galena, grey argenteriferous copper, tellurium ore, gold and silver, antimony and tin.

The mercury mines of Idria in Illyria are almost as rich as those of Almaden in Spain. These two mines furnish nearly the whole of the mercury employed throughout the world in reducing the ores of silver, and other purposes for which this metal is needed.

The copper mines of Agordo, in the Lombardo-Venetian territory, must also be mentioned among the

mineral resources of Austria. They are not, at present, in an active state, but everything leads to the conclusion that the deposit is an important one. We must also refer in this enumeration to the salt mines of Transylvania and Wieliczka, celebrated not less for the enormous extent of the excavations than for the thickness of the deposit.

We have just stated, that the Austrian exhibition, as referred to this Jury, is chiefly remarkable with regard to iron, and we have also observed, that the iron-works being grouped into natural districts determined by the position of the ores and the abundance of forest, the working in iron and steel must necessarily present very similar products. The Jury have thus had some difficulty in the distribution of the rewards, and they have been for the most part guided in their decision by the greater or less care shown by the different proprietors to exhibit their methods of working, and by the elaborateness rather than the nature of their products, which are all generally of the finest quality. There is, indeed, only one exception to this, the case of the *BARON VON KLEIST* (424, p. 1031), to whom a Council Medal has been awarded for a sheet iron, called paper iron, of extreme thinness and great strength. This beautiful material, which is altogether peculiar, has been unanimously considered by the Jury, as well as by those gentlemen whom they associated with them, as worthy of the highest distinction. The details already given at the commencement of the Report on the sheet iron of this Exhibitor have made known the motives for this decision of the Jury, and we only now, therefore, refer to them.

Of the other iron-masters the Jury have more especially distinguished eighteen, to seven of whom Prize Medals have been granted, while the others, whose exhibits were less complete, have been Honourably Mentioned. We proceed to speak of each in the order of their occurrence in the Catalogue. The objects exhibited being, for the most part, similar, we only give details where there exist some essential points of difference.

Zos, Widow, CARL, of Tauerburg, in Carniola (405, p. 1030). This exhibitor has added to the iron ores used in her foundry the grey pig for wrought iron, white pig for steel, and the different qualities of iron and steel which she manufactures. She has also sent some manufactured iron, especially nails, and has accompanied these objects by the slags and cinder obtained at the different periods of the process.

Most of the products of the Tauerburg works are exported to Italy, where they are much valued. Till within a few years there was only a small quantity of iron manufactured at this establishment, but latterly it has much increased. The difficulties experienced in developing an industrial occupation so complicated as that of iron, in a poor country where everything has to be provided, speak at once in favour of the excellence of the products of these works, and the wise and enlightened spirit which conducts them.

COUNT FERDINAND VON EGGER, of Carinthia (409, 410, 425, p. 1031). The Jury have associated in one notice the products of the works at Lippitzbach, Freibach, and Festrütz in Carinthia, all belonging to the Count von Egger, and exhibited by him. The pig and bar iron are made at Lippitzbach, and the other two establishments are intended for the manufacture of iron and steel. The products exhibited in No. 425 include blistered steel, rolled steel, and steel wire.

The puddling and reheating furnaces in these works are supplied with wood fuel, and the work proceeds with great regularity and great economy. The establishments of Count Egger were the first in Austria in which the English methods were introduced, and they have served as models, their proprietor having, in the most disinterested manner, permitted them to be copied.

IMPERIAL DEPOT OF IRON MINES AND IRON WORKS at Vienna (408, pp. 1030, 1031).

The Austrian Government possesses several iron and steel works in Styria, the products of which have been collected and exhibited together under this title. They include—

1. Spathic ores, for the most part passed into the state of hydrous oxide, and yielding an ore of very fine quality.

\*The "measure" is equivalent to 56 kilogrammes, or about 123 lbs.—I. W.

2. Grey pig, from the foundries of Zell, in Styria, which enjoy a high reputation in the country.

3. White pig, from Eisenerz, in Styria, of different qualities, from a finely-porous to a large laminated grain.

4. Specimens of steel, raw, forged, and cast.

5. Slags and cinder produced in the various processes of smelting and preparing iron and steel, according to the different ways in which the furnaces are worked.

6. Manufactured iron and steel. We may especially notice here the rails, of whose admirable quality the Jury have satisfied themselves, and which afford a fracture remarkable for the homogeneity of the grain.

**TÖPPER, A.**, of Scheibbs, Lower Austria (411, p. 1031). Among the numerous objects sent by this exhibitor, we specify particularly the hollow iron made at his foundry. The tubes are of excellent quality, and we learn from Professor Tunner, the Austrian member of the Jury, that M. Töpper's establishment enjoys a high reputation for the manner in which it is directed, as well as for the excellence of its produce. The work is carried on in a very economical manner, and for 15 years the gases of the furnaces have been used economically in some of the operations.

**PRINCE SCHWARZENBERG**, of Murau, in Upper Styria (417, p. 1031). The foundry of Murau is intended for the production of hard iron and natural steel: the exhibition made by the Prince is very complete, presenting an assortment of different qualities of iron and steel, as well as cinder of all the operations. We may again state that the steel is of admirable quality, enjoying a well-founded reputation in Austria and the Lombardo-Venetian Kingdom.

**FISCHER, A.**, of St. Agide, in Lower Austria (420). Brown spathic iron ores; white, grey, and speckled pig, obtained from charcoal fuel; bar iron of different kinds; steel, raw and forged; iron wire, rolled and drawn. All these are of excellent quality. The mechanical arrangements in M. Fischer's works are remarkable for their finish, and for the facility with which they admit of the different operations being performed.

**THE WÜLLERSDORF TIN-PLATE WORKS**, Lower Austria (423, p. 1031). This establishment, intended for the manufacture of tin-plate, is of modern construction, and the proprietors have availed themselves of the most recent mechanical improvements and contrivances. The products are not inferior in quality in any respect to the best tin-plate manufactures in England and Belgium. This is considered to be the largest establishment of its kind in the country.

The different iron-foundries, whose various products we have here mentioned in a very summary way, have each obtained Prize Medals; and before proceeding to give a few details concerning those other establishments of the same nature which have been adjudged Honourable Mention, we desire to notice one more to which the Jury have awarded a Prize Medal. It belongs to **J. B. Egger**, of Villach, in Carinthia, and it has for its object the manufacture of sheet lead and lead tubing. The products exhibited (435, p. 1032) are tubes of various bore and different dimensions, one of them being 1800 feet long. Notwithstanding this great length, the bore is perfectly cylindrical, and the thickness is the same throughout.

The Jury have awarded Honourable Mention to the following Exhibitors:—

**THE COMMUNITY OF RADMEISTER**, at Verdenberg, Styria (400, p. 1030). A collection of ores, pig iron, slags, iron, and steel. The furnaces, which have been recently enlarged, are worked with hot blast.

**THE PRINCE FÜRSTENBERG**, Bohemia (412, p. 1031). The products of his foundries in Bohemia, especially the boiler-plate, are all of very excellent quality.

**THE COUNT VON BOUQUOT, Kallich, Bohemia** (414, p. 1031). In these works bar iron is obtained from turf fuel. The sheet iron, both black and white, appears very fine.

**THE COUNT G. ANDRAÁSY, of Dornö, Hungary** (415, p.

1031). In these works the puddling and reheating of the iron are carried on by the aid of reverberatory furnaces, supplied with the charcoal of brushwood, otherwise of no value. This important modification, which has introduced a great economy in the manufacture of the iron, is not alluded to in the collection of products from the Dornö foundry.

**FISCHER, B.**, of Teislen, Lower Austria (421, p. 1031). These works, chiefly manufacture cast steel; their products are carried into all parts of Germany.

**HUBER, F.**, of Josefsthal, Styria (428, p. 1031). Iron and steel wire of different kinds. The Jury have noticed steel wire of very excellent quality, one specimen being remarkable for its extreme fineness and great tenacity.

**SCHIEDL, CARL**, Wasserlug, Lower Austria (429 p. 1031), likewise exhibits iron wire of fine quality.

Ordinary Mention is made of the following:—

**IMPERIAL FOUNDRIES OF PILLERSEE AND TENNBACH**, in the Tyrol (407, p. 1030).

**FOUNDRY OF THE CHAPTER OF GURK**, at St. Magdalene, Carinthia (416, p. 1031).

**STEEL WORKS OF MR. J. PFEIFFER**, at Spitzbach, Styria (418, p. 1031).

**STEEL WORKS OF THE COUNT VON THURN**, at Streileben, Schwarzenbach, and Müss, Carinthia (419, p. 1031).

**FORGES OF MR. H. D. LANDHEIM**, at Plan, in Bohemia (422, p. 1031).

#### Other Metals besides Iron.

Of the whole number of collections which relate to the production of other metals than iron, the Jury have remarked six as possessing interest from the methods they indicate and the objects they exhibit, each of which has been deemed worthy of Honourable Mention. They are as follows:—

**IMPERIAL ADMINISTRATION OF MINES IN VIENNA** (2, p. 1006). For a collection illustrating the processes of obtaining mercury in Idria and lead at Bleyberg, and for extracting sulphur from pyrites at Sworowicz, in Galicia, and at Radoboj, in Croatia.

**SZEMRÁK, J. P.**, of Neusohl, Hungary (4, p. 1006). Ores of cobalt and nickel from Boiza, with metallic nickel and cobaltiferous products. This collection illustrates the preparation of nickel, the oxides of cobalt and nickel, and the different salts obtained from cobalt.

**KOCHMEISTER, F.**, of Pesth, Hungary (5, p. 1007). Similar products obtained in the preparation of nickel and combinations of cobalt.

**VOLDBAUM, G.**, of Salzburg (13, p. 1007). Preparation of arsenic, of the white oxide of arsenic, and of yellow and white glass made with this metal.

**COUNT FERDINAND VON ERWEIN SCHÖNBORN** (15, p. 1007), and the **PRINCE VON LOKOWITZ** (16, p. 1007), who have exhibited a fine collection of pyrope garnets, rough and cut.

**MATSBACH, A.**, of Vienna (1, p. 1006), for a collection of lignites from Upper and Lower Austria, Styria, Moravia, and Hungary. These lignites, all of which are worked by the exhibitor, belong to various formations. They are now much and widely used for many purposes, and are employed in puddling furnaces for iron.

To complete the list of objects in Austria, considered by the Jury worthy of Ordinary Mention, we have still to record those exhibited under the five following numbers, viz.:—

**THE PROPRIETOR OF THE MINE OF ZEMBERG**, in Hungary (7, p. 1007), for ores of cobalt and nickel.

**BATE, W.**, of Prague (9, p. 1007), for ores of uranium, nickel, cobalt, and vanadium.

**SZUO, M.**, of Koseva, in Hungary (10, p. 1007), for ores of antimony and metallic antimony.

**HOCHBERGER, J.** (14, p. 1007), for the manufacture of sulphate of iron and alum, and the production of sulphur from pyrites.

**COUNT G. EGGER, of Krappenberg, Carinthia** (401, p. 1030), for a series of crystals of sulphate of barytes.

#### BELGIUM (p. 1150).

The mineral industry of Belgium is represented in the Crystal Palace by 58 exhibitors; but the most important

\* This Exhibitor receives a Prize Medal in Class XXII., in whose Award List his name appears.—I. W.

department of all, and that which has furnished to this country a source of wealth altogether disproportionate to its superficial extent—we mean the working of coal—is brought under notice by only a few isolated specimens, while the iron works, clay works, refractory sandstones, and grindstones, have furnished the greater part of the objects exhibited. To render as brief as possible the general account of the different rewards granted by the Jury, we shall group them according to the nature of the products.\*

We must first recall attention to the fact that the Council Medal has been awarded to the Company of Zinc Mines and Foundries of the *Vieille Montagne*. The high reputation enjoyed by this establishment, whose products are exported to all parts of the world, fully justifies this distinction, and we will not here repeat the reasons which have guided the Jury in its judgment, and which we have already stated at the commencement of this Report.†

The first object that has attracted the attention of the Jury is the safety-lamp, of which two kinds are exhibited; one by Mathieu Louis Mueseler, mining engineer (24, p. 1151), and the other by Félix Eloin, associate engineer (11, p. 1151).

Long experience has established the advantages of M. Mueseler's lamp, more than twelve thousand of these instruments being at present in use; and we may attribute partly to its adoption the sensible diminution that has taken place in the number of accidents from the explosion of carburetted hydrogen gas in those mines, where gas is constantly given off from the coal.

In this lamp, a part of the metallic covering which surrounds the flame and forms the chimney, is replaced by a glass, a modification which insures a much stronger light than that given by the Davy lamp, and which is preferred by the miners; but the essential peculiarity of M. Mueseler's arrangement consists in the mode in which the air to support combustion is introduced. It is brought in from above, through two wire gauzes at right angles, to each other, and afterwards escapes, with the products of combustion, by a central chimney.

The chief objection that at first suggests itself to this lamp, is the brittleness of the glass; and on this account the Jury for some time hesitated in admitting any marked superiority in it over the Davy lamp. But the Belgian government having communicated the official reports of experiments made by a special commission, their doubts have vanished, and they have granted a Prize Medal to M. MUESLER.

It results from these experiments "that the resistance of the glass has been found to be infinitely superior to that which could be presented by wire gauze, and that in this respect it offers a greater security; that the instances of fracture have been very rare, and that on no occasion, whatever the cause of the fracture may have been, has it resulted in the introduction of the external air to the interior of the lamp. On the other hand, the fragments of glass have always remained in their place until the lamp was opened."

The lamp of M. Eloin is also provided with a glass in its lower part, and the inventor has given it a conical form on the outside, to disperse the rays of light, and diminish, as much as possible, the numerous shadows produced by the opaque parts of the lamp. The essential difference between this lamp and that of M. Mueseler consists of an apparatus for admitting the air and distributing it round the flame. This apparatus is simply a ring of wire gauze, pressed between two circles, having several openings corresponding to each other, and resting on the edge of the lid of the reservoir of oil. This exhibitor, as well as Messrs. Roberts and Combès, has added a peculiar trumpet-shaped contrivance, of which the larger end rests on the oil reservoir, a little below the air-holes, the upper part having a circular opening about three-quarters

of an inch (18 to 22 millimetres) in diameter, placed about three-eighths of an inch above the bottom of the wick. This arrangement makes it necessary, that the air introduced to feed the flame should pass quite close to the wick, which is flat, and the combustion is thus rendered more active, while the inflammable gas is more or less consumed as soon as it enters the lamp.

The Jury have examined with interest the lamp exhibited by M. Eloin; but as it is at the present time submitted by the Belgian government to a special commission, who will report on the advantages or defects that it may possess, they have thought it best not to publish an opinion with regard to it. They think it right, however, to state that the experiments made by Messrs. Blackwell, Rogers, and Smith, in the coal mines of Abercarn, near Newport, and of Shipsey, in Derbyshire, have satisfied them of the value of M. Eloin's lamp.

#### *Manufacture of Iron.*

The Jury have awarded six Prize Medals and three Honourable Mentions to the Belgian exhibitors in iron. They have been obtained by the following establishments:—

MONCHEUR, F. and A., iron-masters of Ardennes, in the province of Namur (366, p. 1162), who have exhibited pig iron made with charcoal, and various specimens of iron bearing the mark [MBC], also made with charcoal. A part of the iron exhibited by this firm is intended for gun-barrels, and they supply exclusively the royal manufactory of the Belgian government. Mr. Timmermans, inspector of weapons for the government, has certified in an official document handed to the Jury, that not a single gun manufactured of this iron has burst at the proving-house, even under the most extreme trial.

AMAND, J., iron-master, of Remeton-sur-Bierse, Namur (368, p. 1162). This manufacture resembles that of MM. Moncheur, and part of the iron is also intended for making fire-arms.

ORBAN, J. M. and SOY, (372, p. 1162). These exhibitors manufacture iron with coke, and also with charcoal fuel; and besides merchantable iron, they make also sheet iron and iron wire. It is especially for these latter products that the Jury award the Medal, and they wish to mention particularly—

A piece of rolled coke iron, measuring 106½ feet in length, and half an inch (14 millimetres) in diameter, and weighing 86 lbs.

Another specimen, only one-fifth inch (6 millimetres) in diameter, corresponding to No. 4 of the English gauge, measuring 282 feet in length, without a joint, and weighing 42 lbs.

A specimen weighing 55 lbs., the length of which is 375½ feet.

A roll of galvanized iron wire, No. 8, weighing 99 lbs., and measuring 1476 feet, used in the construction of the electric telegraph. Similar wire is not received by the Belgian government till a succession of trials prove it to be capable of supporting at least 1,700 lbs. without breaking, a strength corresponding to 140 lbs. per sq. millimetre (= 40155 sq. inches English). It is also sufficiently malleable to admit of the extremities being bent into a very small eye.

Several pieces of charcoal sheet-iron of various dimensions and thickness, but all of the first quality.

REMACLE, J., and PÉCARD, of Liege (371, p. 1162), have exhibited sheet iron of different numbers, manufactured with wood fuel, and of very excellent quality.

DELLAKE-MATTHIEU, C., of Huy (376, p. 1163). A complete assortment of common and polished sheet iron and steel, whose high degree of excellence will perhaps be most easily seen in their small thickness compared with the dimensions, their perfectly-continuous surface, the absence of all oxidation, their ductility, and their tenacity.

The POMEROL SMELTING COMPANY, (6, p. 1160), for the specimens of pig and rolled iron, produced at their works, and exhibited by them.

Honourable Mention has been awarded to J. COCKERILL,

\* This outline is borrowed in great part from a note addressed to the Chairman of the Jury by M. Gernaers, Ingenieur en Chef des Mines Belges, and Member of the Jury.

† See ante p. 2.

of Seraing, Liège (119, p. 1155). The Company has exhibited specimens of pig and wrought iron, wheel tire for locomotives, manufactured iron, and especially rails. This Jury, not taking into consideration the manufactured articles, which it is not their province to judge of, and regarding it as almost certain that the Cockerill Company would obtain honourable distinction for the admirable construction of its machines, have been guided, in some measure, by these reasons in only making Honourable Mention of their products in this place.

Messrs. PÉKARD and MINEUR, of Couvin (18, p. 1151), for their iron ores and bar iron.

The MARCINELLE and COUILLET SMELTING COMPANY\* (20, p. 1155). The iron which this company exhibits is of very excellent quality; but they are placed in the same category as the Cockerill Company, exhibiting machines as well as raw produce.

#### Zinc and Brass Works.

THE NOUVELLE MONTAGNE ZINC MINING COMPANY, at Verviers (7, p. 1151).

The exhibition sent by this company includes lead and zinc, in pig and manufactured articles in zinc, the latter consisting of sheet zinc for various uses, such as engraving, smoothing paper, sheathing for ships, zinc tiles of different forms, &c., and zinc powder (oxide of zinc) for painting. To illustrate the uses of the different kinds of tiles, &c., the company has added two models of roofs remarkable for their lightness. The Jury recognize the good quality of these by awarding the Prize Medal to the company.

CHAUDRON, Messrs. C. and H., of Liège (377, p. 1163), have also obtained a Prize Medal, for boiler-tubes of locomotives exhibited by them. These tubes, which are drawn and completed without joint, are of very beautiful manufacture.

#### Terra Cotta, Bricks, Crucibles, Refractory Clays, and Kaolin.

This department of mineral industry is well represented in the Belgian Exhibition, and has obtained several Honourable Mentions. Notwithstanding the interest belonging to such products, on which the success of some establishments, as of cast steel or glass, may depend, we must be contented with simply naming the Exhibitors as worthy of Honourable Mention.

PASTON, B. & Co., of Ardenies, Namur (335, p. 1163), have exhibited:—

1. A gas-retort, weighing 1474 lbs.
2. The hearth of a blast furnace for coke fuel, made of refractory bricks, and weighing 504 lbs.
3. A series of refractory bricks, for lining different parts of blast furnaces, also burning coke fuel.
4. Drainage pipes of various dimensions.
5. Specimens of clay of different qualities, especially refractory clay.

The same distinction is awarded to F. COSTE,† of Tilleur, Liège (397, p. 1163), who has exhibited two sets of crucibles, the one made of a mixture of plumbago with clay, and the other of refractory clay only. The former are intended for fusing steel, and are divided into three parts, the lowest of which only is the crucible, properly so called, the intermediate portion serving to contain an additional charge, so that when the fusion is complete, the true crucible is entirely filled. The Jury notice this arrangement as presenting some interest.

The Exhibitors having the numbers 12, 14, 15, 396, and 399, have obtained Honourable Mention.

TOSNELLE-LOMBA, E., of Bonneville (12, p. 1151). Specimens of porcelain clay.

DR. GAUFFIER D'HESBOY, the Baron of Maffieu, near Namur (14, p. 1151). Specimens of porcelain clay.

DE FENHARS, F., and L., of Vierde, near Namur (15, p. 1151). Specimens of plastic clay, employed in the manufacture of fine pottery.

\* This Company was awarded a Prize Medal by the Jury of Class V., in whose list its name appears.—I. W.

† This Exhibitor has been awarded an Honourable Mention by the Jury of Class XXVII., in whose list his name appears.—I. W.

TENSONNET and DARTET, of Namêche, Namur (394, p. 1163). Samples of fire-clay.

COMMUNAL COMMISSION OF MARCIN (396, p. 1163). A quartzose conglomerate with a silicious cement, forming the base of the coal measures, and yielding a material absolutely refractory for the construction of the hearth or crucible of blast furnaces. Blocks of this conglomerate cut and arranged for the construction of a crucible or hearth.

BOUCHER, T., of Landoult (399, p. 1163). Specimens of refractory clay; gas retort manufactured of this clay. Saggars, for baking porcelain.

#### Slates, Grindstones, Hones, &c..

Belgium, a country which consists in great part of palaeozoic deposits, possesses a great number of rocks adapted to the manufacture of grindstones and hones; and as the slate formation (one member of the group) is especially developed, the working of slates is also very active in this country. The geological constitution, which always has a great influence on the commerce of a country, here exercises a powerful action, and this department of industry is represented in the Crystal Palace by several exhibitors. Since, however, slates, whetstones, and other products of this kind, require no change in preparing them for the market, the peculiar form in which they are wanted involving the only modification they undergo, so that there are thus no very great difficulties in the way of their preparation, the Jury have only thought it necessary to distinguish them by Honourable Mentions, except in the case of M. E. DE ST. HUBERT (8, p. 1151), to whom a Prize Medal was awarded. The account of them would be almost exclusively technical; so that, notwithstanding the interest which attaches to this branch of industry, it is impossible in this Report to do more than enumerate the products.

COLLETTE DORET, F. L., of Bertrix, Luxemburg (5), has exhibited:—

1. Writing stones (slate pencils?)
  2. Hones from different rocks, and for various purposes.
  3. Specimens of slate of various qualities and sizes.
- JEAN ANTOINE GUILLAUME, of Bouvigny (1, p. 1150),  
CHARLES JOSEPH OTTE, of Vielsalm (2, p. 1150),  
CHRISTOPHE LAMBERTY, of ditto (3, p. 1150),  
PIERRE JOSEPH OTTERGELD, of ditto (4, p. 1150),  
LAMBERTY BROTHERS, of Stavelot (25, p. 1152),  
DE PIERRE, jun., of Vielsalm (494, p. 1166),

have all exhibited very good collections of whetstones, as remarkable for their dimensions as for the care taken in their preparation.

J. B. FALLON-PHON, of Namur (10, p. 1151), has exhibited a fine black of black marble, peculiar to the district, which can be produced in large masses, and at a low cost.

ED. DE ST. HUBERT, of Bouvignes (8, p. 1151), and J. B. MICHAMONT (9, p. 1151), have exhibited millstones of good quality, the collection of the former being on a more extensive scale, which induced the Jury to select him for the award of the Prize Medal. This source of industry was only introduced into Belgium since 1840, but has already become important. The millstones from the province of Namur possess qualities which render them comparable with those from La Ferté-sous-Jouarre, in France.

#### CHINA.

China, so richly represented in the Crystal Palace by its silk, stuffs and porcelain, has only obtained a solitary Honourable Mention for its mineral productions. This is granted to R. ALCOCK, Esq., H. B. M.'s Consul at Shanghai (1, p. 1418), for a collection of materials employed in porcelain manufacture at the great porcelain works of Kiaing Tih' Chin, near the Poyang Lake.

This collection includes specimens of prepared clays, and also a series of pigments employed in porcelain work. In their present state it is impossible to determine the nature of the materials without analysis; but they are exactly analogous to a more complete collection forwarded to the Ecole des Mines in 1846 by Mr. Stanislas

Julien, member of the French Institute, who had received the specimens from Mr. Joseph Li. To the prepared clays, Mr. Li had added some compact feldspathic rocks resembling the Cornish elvans. These rocks are reduced to a paste under a mill, and serve partly for covering the porcelain with a glaze, but are also mixed in various proportions with the paste intended for the porcelain, according to the nature of the material which it is intended to prepare.

#### CHILI.

We have already, at the commencement of this Report, referred to a magnificent specimen of native silver, weighing 154 lbs., obtained from Chili (p. 1429).

The mines of copper, without affording so important a supply of mineral wealth to Chili as those of silver, have still obtained a great development within a few years, and this republic is now placed among the number of those countries which supply Europe with a sensible proportion of the copper used in manufacture. The ores of this metal worked in Chili are of two kinds—vitreous copper ore (the disulphuret) and copper pyrites (sulphuret of copper and iron), which exist in different deposits, the former ore occurring in veins more or less continuous at the separation of the crystalline from the calcareous rocks. This ore, always very rich, often occurs in considerable nodules, and two specimens are in the Exhibition from the district of Tamaya, remarkable for the purity of the ore. Their weight is stated at 250 lbs., and their yield at 62 per cent.

The copper pyrites occur in veins in the gneiss, and are associated with iron pyrites, calcum, and ores of gold and silver. Messrs. SCHNEIDER and Co. have exhibited a very fine specimen (not numbered), stated to contain 12 ounces of gold and 220 of silver (p. 1439). This specimen presents the appearance of a quartz rock passing into gneiss, in which the copper and iron pyrites form a tolerably thick vein. Galena may be observed disseminated in small quantities parallel to the lamination of the gneiss, but neither silver ore nor native gold can be distinctly perceived. The iron pyrites appears in two very distinct conditions, viz., in imperfect crystals of a gold-yellow colour, and in dull portions, having a compact fracture of a greenish-yellow colour. Possibly the two precious metals are associated with the latter variety of pyrites, the peculiar and exceptional characters of which agree with the supposition of there being an admixture of metals.

This fine specimen is from the mine of Madre Dios, near Cuzco, and was obtained at the depth of 49 yards below the surface, and weighs 300 lbs. An Ordinary Mention is awarded to the exhibitors.

#### EGYPT.

The Egyptian Government has exhibited (1 to 18, p. 1412) some minerals, which would be of interest if they were accompanied by indications of their origin; but, with the exception of the natron obtained from the lakes in Lower Egypt, we are ignorant of the localities whence the various specimens come. They belong to clays for the most part ochreous; but one, notwithstanding this condition, is described as refractory. There is also a specimen of sulphur adhering to limestone, somewhat resembling the mineral found in Sicily. Besides gypsum and some tolerably fine slabs of oriental alabaster.

The Jury, while regretting not to have been able to procure details concerning the position of these minerals, have still testified the interest which they feel in the discovery of sulphur in the Egyptian territory, as well as in the extraction of natron, and they make Honourable Mention of these two objects.

#### FRANCE (p. 1468).

The mineral industry of France is at present almost entirely concentrated in the working of coal and the production of iron, which have both acquired a considerable development; but notwithstanding this, its territory is not less rich in metalliferous deposits than several other countries in Europe celebrated for the prosperity of their mines. Official documents, recently published by the French Government, show that the number of

known and worked mining localities amounts to 500, which, in relation to the crystalline rocks, may be grouped into five metalliferous districts corresponding to the five mountain ranges of Brittany, the Centre of France, the Vosges, the Pyrenees, and the Alps. These communicate to France a peculiar geological character; and in some degree equalize the climate, the higher mountains being situated in the southern part of the country.

It is clear from written documents, and yet more from the existence of old galleries and extensive heaps of rubbish, that most of these mines were worked on an extensive scale during the dominion of the Romans, and still later under the feudal lords. After the time when the powers of these lords were reduced under a central authority, tradition informs us that the workings were gradually diminished, and only presented rare intervals of activity or success. The revolution of 1793 gave the finishing stroke to this source of industry, which requires a prospect of security, and the mines at that time flourishing were abandoned. There are now in France hardly ten metal mines in activity, and of these only four are really important. They all have for their object the extraction of argentiferous lead ore, and their total mean produce within the last ten years is only about 42,000/. (1,050,200 francs). We may indeed add to this small sum, 10,000/., as the value of the manganese mines, 1,500/., or 2,000/., for the production of antimony, and 3,200/., for the reopened copper mines of St. Bel and Chessy.

The working of coal and the production of iron form a happy contrast to the workings of metal mines, and we proceed to make known in a general way these products.

#### Working of Coal.

About the commencement of the eighteenth century this branch of mineral industry, now so flourishing, hardly existed at all; the coal known at that time at St. Etienne, Alois, Vigan, and St. Gervais, in the department of Herault, being used only by the blacksmith; and it was not till this time that any serious researches were made for coal deposits. In 1734 was first discovered the existence of mineral fuel at Anzin, now the centre of one of the finest coal districts in Europe; while in the same year commenced the workings at Creusot, a spot which has become the centre of the important coal district of the Saône and Loire. From the date of these discoveries the use of coal became more widely extended, and it was soon applied to the manufacture of glass and the burning of lime; but it is only since 1802, a period when industry made rapid progress, that the extraction of coal acquired an important development. In 1789 the total production in all France barely reached 215,000 tons; but in 1802 it had already increased to 900,000. Stationary then till 1820, it rose in 1830 to 1,600,000 tons. In 1845\* the official returns show that it reached to 4,202,091 tons, and now France occupies the second place in reference to the production of this mineral, immediately succeeding England, whose production is, however, eight times as great.

The vast development of the extraction of coal in France attests the corresponding development of all those industrial occupations of which coal is one of the elements of production. It affords a startling proof of the progress made in all the useful arts during a period of a third of a century passed in perfect peace.

#### Production of Iron.

The manufacture of iron has always been tolerably active in France. The ores of this metal exist there in almost all the geological formations, but are especially abundant in the middle tertiary deposits which cover the elevated plains of Champagne and Berry, and generally the vast expanse of oolitic limestone which forms the central plateau of France, occupying more than two-thirds of the whole surface of the country. The tertiary deposits, generally sandy, are not very fertile, and have for centuries been devoted to the growth of wood; and

\* Comptes rendus des Travaux des Ingénieurs des Mines, tome xiv., 1846, p. 21.

this position of the iron ores in the midst of forests has always been taken advantage of for the construction of foundries. Each of the tertiary plateaux has thus long been a small metalliferous district where the manufacture of iron was active in proportion as the wood was abundant; and these districts have for many ages been the only sources of the supply of iron.

Within the last 25 years, since the manufacture of iron has been carried on with coal fuel, the position of these establishments where wood was employed has been essentially modified; and, in fact, the introduction of iron made with coal, the cost of which is so much lower than when made with wood, and which is only limited in quantity by the extent of the demand, has changed the conditions which nature seemed to have established. Charcoal iron could not have borne up at all against the formidable competition of that made with coal, had there not been an important modification of the methods of treatment, consisting of the introduction of coal in the ultimate processes adopted to produce wrought iron from the pig, the use of charcoal fuel being retained in the first production of the pig itself. These further processes with coal fuel are carried on in works specially constructed for the purpose on a large scale, situated where the coal can be obtained at a moderate price. This mixed method has produced a great reduction in the price of iron, which has fallen from 70 to 27 francs for charcoal iron, and from 52 to 22 for that made with coal; and the difference in price has been obtained without the superior quality of the charcoal iron being at all affected.

This method, while lowering the price, has also given a great development to the manufacture of pig and wrought iron. If, for example, we take the production of pig as the term of comparison, we find that between 1819, when it amounted only to 112,000 tons, and 1845, when it reached 522,385, the increase was in the proportion of 100 to 465. Even this is only the fourth part of what is produced by Great Britain; but on the Continent, France is now placed in the first rank of iron-making countries. It appears, from statements made in the annual report of the *Corps des Mines*, that the three countries on the Continent which come next in order to France in the manufacture of iron, are Russia, Sweden, and Prussia, and that the make of the first from 1835 to 1838 was 189,000 tons of pig, of the second, in 1839, 115,000 tons; and of the third, in 1840, 112,000 tons. The average in France of the three years 1835 to 1838 was 239,000; in 1839, 305,000; and in 1840, 348,000.

The mixture of fuel adopted has allowed of the use of part of the vegetable fuel, formerly employed in the manufacture of wrought iron, for the making of pig; but, at any rate, the statistics of the iron trade in France distinctly show that the use of coal in preparing wrought iron is very far from having diminished the consumption of charcoal. Thus we find the quantity of pig iron made with coke and charcoal respectively thus stated:—

| Years. | Quantity of Pig Iron made with Coke. Tons. | Quantity of Pig Iron made with Charcoal. Tons. | Total Tons. |
|--------|--|--|-------------|
| 1819   | 2,000                                      | 110,500  | 112,500     |
| 1839   | 27,103                                     | 272,288  | 299,391     |
| 1840   | 77,063                                     | 270,710  | 347,773     |
| 1846   | 239,702                                    | 282,683  | 522,385     |

Whence it appears that while, in 1819, the amount of pig iron made with coke was only one fifty-sixth part of the whole production, it amounted in 1830 to a thirteenth part, and in 1846 reached to 46 per cent., or nearly half of the whole amount.

A similar fact may be observed with reference to the refining of pig; but the proportion of wrought iron manufactured with coal, being much larger than in the former case, the equality of production from the two sources was established between 1835 and 1838; after which latter date, the consumption of charcoal in this branch of the manufacture has been nearly stationary, the produce ranging at less than 110,000 tons of iron. The use of coal has, however, continued to increase, and in 1846, 70 per cent. of the wrought iron was thus made. The

following tabular statement establishes this interesting fact:—

| Years. | Quantity of Iron made with Coal. Tons. | Quantity of Iron made with Charcoal. Tons. | Total Tons. |
|--------|--|--|-------------|
| 1819   | 1,000                                  | 73,200                                     | 74,200      |
| 1835   | 101,380                                | 108,159                                    | 209,539     |
| 1838   | 115,110                                | 109,085                                    | 224,195     |
| 1846   | 254,325                                | 105,865                                    | 360,190     |

The production of pig iron requires at least 130 per cent. of charcoal,\* for making, refining, and rolling; and the different processes of manufacture of charcoal iron consume at least 145 per cent. Combining these figures with those which precede, we find that the total consumption of charcoal in the production of cast and wrought iron in 1819, was only 250,137 tons, whilst in 1846, it might have risen to 519,991, the latter amount being, however, in all probability, too great, since even in the charcoal foundries they frequently use coal in the re-heating process; but if we grant that this substitution diminishes the consumption of wood by one-half, it still results that the total consumption, in 1846, reached 443,239 tons, being almost double that of 1819. The use of coal in the manufacture of iron has not therefore, as is commonly enough supposed, done away with the use of charcoal. The two methods of operating have increased together, and on the same scale; and, on the whole, the production both of cast and wrought iron has been quadrupled.

After this general summary concerning the manufacture of cast and wrought iron in France, it is right to observe that the weak point with regard to the metallurgical industry of that country consists in the dearth of fuel. It possesses inexhaustible stores of ore distributed in numerous localities, easy of extraction, rich, and in almost all cases of excellent quality. But so long as

\* In many parts of France, only equal quantities of pig and charcoal are used, but the quantity stated in the text is a general average. We find, in fact, from the "Comptes rendus des Travaux des Ingénieurs des Mines," for the year 1846, p. 57, that the production of charcoal pig, and the consumption of fuel, were as follows:—

|                        | Met. Quintals. | Charcoal, 3,316,843 |
|------------------------|----------------|---------------------|
| Pig, for refined metal | 1,523,106      |                     |
| Ditto for casting      | 535,260        |                     |
|                        | 2,464,366      |                     |

Which shows a consumption of 130 parts charcoal for 100 of metal. With regard to the further processes of manufacture by charcoal, we find, p. 59, that the refining at—

|                  | Met. Quintals.           | Met. Quintals. |
|------------------|--------------------------|----------------|
| Comtois produced | 82,143 of bar iron, with | 1,184,381      |
| Wallon "         | 40,902 a consumption     | 78,624         |
| Nivernais "      | 4,131 of charcoal of     | 10,977         |
|                  | 874,434                  | 1,273,982      |

Whence it follows that these methods combined show a consumption of 145 parts of charcoal for each 100 parts of wrought iron.

Applying these figures to the production of pig and wrought iron in 1819 and 1846, we find—

| Years. | Total Tons.   | Total Tons. |
|--------|---|-------------|
| 1819   | 110,000 of pig iron, requiring 143,650 of charcoal. |             |
| 1846   | 282,683   | 366,487     |
| 1819   | 73,200 of wrought iron "                            | 106,140     |
| 1846   | 105,865   | 183,504     |

The consumption of charcoal being therefore—

|      | Tons.                    | Total Tons. |
|------|--------------------------|-------------|
| 1819 | For pig iron 143,650     | 249,790     |
|      | For wrought iron 106,140 |             |
| 1846 | For pig iron 366,487     | 519,991     |
|      | For wrought iron 153,504 |             |

If we suppose that in 1846 the charcoal foundries have used half charcoal and half coal, we shall still find the consumption of charcoal to be—

|                  | Tons.   | Total Tons. |
|------------------|---------|-------------|
| For pig iron     | 366,487 | 443,239     |
| For wrought iron | 76,752  |             |

charcoal costs 84, 100, and even 120 francs (64s. to 96s.) per ton, and coal from 30 to 60 francs (24s. to 48s.) the advantage gained by the condition of the ore is very soon swallowed up, and the whole efforts of the iron-masters must be directed towards economising fuel. Great improvements have already been made in this respect in the working of iron, and, no doubt, the incessant efforts of the manufacturer will produce others; but we are quite safe in asserting, from the knowledge we possess of this kind of operations, that France can never succeed in producing iron by these mixed methods at the same price as it is made at in those places where the manufacture is carried on by coke exclusively, and especially at the very spots where the coal is worked.

An exhibition in London of the various modifications at present introduced into the manufacture of iron would have been very interesting for the study of metallurgy, and it is greatly to be regretted that so few of the French iron-masters have responded to the appeal made from England on this occasion. We are satisfied from the good feeling that has been shown to all French exhibitors, and the friendly relations that have constantly prevailed amongst all the members of the Jury, that their efforts would have been duly appreciated, and that all the improvements which they have introduced within the last twenty years would have received honourable rewards.

The almost entire absence of iron from the French portion of the Great Exhibition, and the small number of objects relative to the working of coal that have been sent, have prevented this branch of industry in France from appearing as important as it really is. The secondary departments of mineral industry have better appreciated the advantages offered by the great idea of a Universal Exhibition, and have sent objects worthy of interest, so that France has still an honourable position amongst the rewards granted by the Jury of this Class. It remains now to make known these rewards; but the task is difficult and unsatisfactory, for the great diversity of the objects only allows a very imperfect arrangement in describing them: we shall, however, endeavour to bring those exhibitors together whose objects have the nearest analogy one with another.

We must first recall attention to the two exhibitors to whom the Council Medal has been decreed. These are

Mr. BÉLARD (51, p. 1173), for his coal-washing apparatus.

Messrs. ESTIVANT, Brothers (1214, p. 1235), for the size and quality of the objects exhibited by them in rolled and hammered brass.\*

Mr. F. MÉRIT, mining engineer, of Anzin (627, p. 1238). Apparatus for the extraction of coal, and for the descent and ascent of mines.

It is now some years since a contrivance was introduced into the mining districts of Germany, England, and Belgium, the object of which was to prevent the great fatigue and frequent accidents experienced by miners on account of their having to descend and ascend the shafts of deep mines by means of vertical ladders or by the tubs and tackle used in lifting the produce. This apparatus consists of two wooden beams placed in the same shaft opposite to and balancing each other, and moving up and down by an alternate vertical motion communicated by machinery. On each of these beams small sets of horizontal planks or steps are placed, the distance between each being twice the length of one lift. The miner then standing at the bottom on the ascending beam, in order to come to the pit mouth, steps to the opposite plank as soon as by the motion of the frame he is brought to its level, taking advantage of the short interval that elapses while the levels of the two steps are the same. He is then lifted again by the rise of this part of the frame, that on which he first stood descending, and again steps off when the lift is concluded. He thus rises step by step till he reaches the top. One of the best of these machines has been erected by M. Abel Waroqué in a shaft of a coal mine at Marimont, between Mons and Charleroi.

This apparatus was a great improvement in working

mines; but it is exposed to a serious inconvenience, as it is impossible to lift ore or coal from the shaft in which it is fixed.

Mr. Méhu has constructed a similar machine, which serves at the same time to lift the ore or coal, and convey the miners to the bottom or top of the pit. It has been in operation for three years in the 'Davy' pit at the Anzin mines, and his long experience has proved its advantage. This engineer has in his apparatus substituted for each of the wooden rods a pair of connected rods, provided with spring catches on which the waggons rest while being raised or lowered. One of these pairs of rods serves to raise the loaded waggons, and the other pair to lower the empty ones; on both lines the waggons are raised or lowered by successive lifts, separated by short intervals of rest, during which they remain resting on other catches, fixed in the sides of the shaft, and arranged in stages at distances a little less than the length of one stroke of the vertical rods.

For lowering or raising the miners, the men step on moveable planks, in the place of the waggons, and the descent or ascent is conducted in the same manner. The depth of the Davy pit, where this machine by M. Méhu is in operation, is 200 feet, the beams traversing 50 feet at each lift.

The Jury, considering that Mr. Méhu's apparatus is likely to be of important service in the working of mines, have awarded to him a Prize Medal.

Messrs. GALLIGHER and COMPANY, proprietors of the foundries of Bigny, department of the Cher (229, p. 1187). The exhibition from these foundries consists of various kinds of merchantable iron. Both iron and wire have been found to be of excellent quality, and a Prize Medal has been awarded to the exhibitors for the excellence of their products.

Mr. A. T. BAUDRY, proprietor of the steel works of Athis Mons, department of the Seine and Oise (1071, p. 1229). The steel-works of Athis Mons, whose origin dates as far back as 1823, consist of two cementing furnaces, and all the furnaces and apparatus required for the reheating, rolling, and forging steel. Its annual production is above 200 tons, and the principal manufacture consists of steel for springs, although M. Baudry has begun to make steel for cutlery. The different kinds of steel are made exclusively from Swedish iron, and the kinds employed are the best of the third quality for springs and iron, and of first and second quality for cutlery. The steel made by this exhibitor is of uniform and homogeneous grain, and the quality has been considered to merit for this establishment the Prize Medal.

Honourable Mention has been granted to the following:—

M. C. LAFÉVRIÈRE, proprietor of the works at Bruniquet, department of Tarn and Garonne (1710), who has exhibited iron of various kinds, admitted to be of good quality.

Monsr. BROUZEAS, of Charleville (1666, p. 1256), who have exhibited a collection of cast-iron vessels, many of them coated inside with enamel.

\* DIETRICH and SON, of Niederbronn (188, p. 1188). The objects sent by these exhibitors consist principally of moulded cast-iron, not coming within the cognizance of this Jury; therefore, while recognizing the excellence of their products, the Jury do not feel justified in awarding more than an honourable Mention to Messrs. Dietrich. They desire to direct attention to several objects remarkable, in the first place, an iron figure of Our Saviour on the cross, five feet high, and on a round plinth which fully attests the care taken in casting in this establishment.

In the second place, they notice a collection of clichés for lithography, which introduce a new application of iron-casting to the art of engraving on stone with machinery. Very fine impressions are thus obtained, and in this particular matter the justly-celebrated Berlin iron ware is equalled by Messrs. Dietrich.

By means of the engraving-machine there may be

\* These Exhibitors have been awarded a Prize Medal by the Jury of Class XXII., in whose list their names appear.

—I. W.

obtained, with these clichés, delicate vignettes, which would seem difficult to imitate, and some of which have already been used for bank cheques and letters of exchange.

They have succeeded at Neiderbronn in giving great softness, tenacity, and flexibility to their cast-iron, and Messrs. Dietrich have exhibited a sheet of this material, measuring 7 feet by 2½ inches thick, which is very flexible. The exhibitors consider that, for some purposes at least, these plates of cast-iron might be substituted for sheet-iron.

GANDILLOT and COMPANY, Rue Bellefond, No. 49, Paris (230, p. 118.) Hollow iron and tubes.

The objects exhibited by Messrs. Gandillot consist of two distinct sets; the one of tubes called *light tubes*, intended for such purposes of construction, furniture, &c., as do not require that the joints should be close; and the other of tubes properly so called, of which the joints, being carefully soldered, are capable of resisting a pressure of at least fifteen atmospheres, and are intended for heating purposes, for conveying gas, or for works for chemical works.

These tubes are manufactured in two different ways, according to the purposes for which they are intended, and the pressure they are to bear. The common kinds, which have to resist a pressure of only fifteen to twenty-five atmospheres, are united at a white heat, being welded by juxtaposition in a series of three to five decreasing draw-plates. The degree of resistance of the wall in these tubes depends on their greater or less thickness.

For purposes requiring a much higher pressure, M. Gandillot makes double tubes, and these he designates "without joint." To make these, he provides two common tubes, such that one will just enter the other with friction. The smaller is then inserted into the larger, the welds being opposite, and in this state he has them drawn out at welding heat, and through a series of decreasing gauges, until the diameter of the external tube has become smaller than that of the one originally included, so that the latter is welded, and, in some measure, incorporated with the other, the two together making a single tube, which is then without joint.

When a punch is forcibly introduced into a tube thus made, it tears it in some part of the circumference, but not in the direction of the welding of the external tube; and if the trial is repeated in different portions of the same tube, which has been previously sawn into several parts for the purpose, at each trial the tear will commence in a different part, so that the measure of resistance possessed by such a tube is that of a piece of iron of equal thickness.

MM. Gandillot have added to their collection of objects exhibited, fragments of tubes that have been tested, and these show that in fact the tearing does take place in various directions. For some purposes, especially for the roasting of animal black, where the vapour requires to be very intensely heated, these tubes, described as "without joint," have perfectly succeeded. MM. Gandillot have, therefore, rendered service to industry by thus providing tubes capable of bearing considerable pressure, and the Jury have, accordingly, granted them a Prize Medal.

Messrs. GROULT and COMPANY, Paris (531, p. 1294). These exhibitors manufacture brass tubing of all sizes, from 1-24th of an inch to 6 inches in diameter, the thickness being so graduated that all the sizes can be placed one within the next above it. They also exhibit tubes for cotton printing, for telegraphic uses, and for locomotives.

The Jury have remarked with interest, amongst the products exhibited by Messrs. Groult, bent tubes obtained by these ingenious manufacturers, by a combination of the ordinary work of tube-drawing, with a regular rotation given to the principal tool used in the operation. These tubes tear less readily than jointed tubes, and are beginning to be used for conveying gas, under the name of "spiral tubes." A Prize Medal is awarded to Messrs. Groult and Co.

M. DUBREUIL, of Lignecourt (Oise) (476, p. 1200). Crucibles for fusing metals. The crucibles manufactured by M. Deyeux are of two distinct kinds, according to the

uses for which they are destined; those intended for fusing bronze, copper, gold, and silver, are marked with the letters [A.D.]; the others, manufactured expressly for the fusion of cast-iron or steel, are marked No. 28.

These crucibles have been in use for the last ten years, and certificates forwarded with the objects exhibited, and signed by the Baron Thenard, and Messrs. Barruel, Darcet, and Despretz, testify to their good quality. The Jury, who have not been able to satisfy themselves by experiment, have been happy to take for the guidance of their judgment in the matter, the opinion of men so learned and so competent to decide, and have accordingly granted a Prize Medal to M. Deyeux.

POULET, J. F., Paris (1680, p. 1257), manufacturer of spun lead. The happy idea of employing spun lead, or lead wire, for horticultural purposes, suggested itself to Mr. Poulet, the resistance offered by this metal to atmospheric influences rendering it in most cases very valuable for binding and tying up vegetable substances. Among the objects exhibited we notice especially some wire of considerable tenacity, whose diameter is only about 3/16th of an inch. The Jury have granted a Prize Medal to M. Poulet.

DERVILLE and Co., Paris (162, p. 1181). Marbles. The quarrying of marbles, which formerly prospered in France, especially under the reigns of Louis XIV. and XV., has been much neglected from the commencement of the present century, Italy within that period having almost exclusively supplied the statuary marble, while Belgium furnished the greater quantity of the marbles used in France for the decoration of private houses. For some years past, however, there have been resumed, under the influence of Government, a considerable number of neglected marble quarries, especially in the Pyrenees and the Vosges.

The exhibition of Messrs. Derville is more particularly directed to illustrate the marbles from the Pyrenees, their collection including upwards of 100 slabs, 16 inches high, and offering at least 20 varieties, among which may be noticed those called Campan marbles, the marble called "griotte" (spotted with red and brown), and the white marble of St. Léat; all remarkable for the variety of their colours, and the beauty of their polish. The Campan marbles also possess a peculiar geological interest in the number of granites which they enclose, and which are often mixed confusedly with the paste; an arrangement which evidences the great amount of change which these limestones have undergone at some period, and which supports the theory of metamorphism. The Jury, taking into consideration the different circumstances above alluded to, have awarded a Prize Medal to Messrs. Derville.

J. R. COLIN, Marble-dealer at Epinal (1564, p. 1251). The marbles of the Vosges, to the treatment of which this exhibitor has especially devoted himself, take a fine polish, but their colours are less agreeable than those of the Pyrenees. M. Colin has also worked the granites, gneisses, porphyries, and diorites, of which there is a great variety in the Vosges; and it is principally these fine rocks that have attracted the attention of the Jury, and have induced them to give M. Colin a Prize Medal. Among the rocks of this kind, so different from their hardness to cut and polish, the Jury have remarked a fine slab of granite with large pink crystals of felspar, the slab measuring 8 feet 2 inches long and 18 inches wide, having an extremely fine polish, but unfortunately cracked in the journey.

Messrs. GUYEVIN BOUCHON and Co. Millstones of La Ferté-sous-Jouarre (532, p. 1204). The millstone rock of La Ferté is a silicious rock, full of interest, presenting a multitude of empty spaces and hard portions, giving it a superiority over all other materials for the manufacture of millstones, and especially over granites and sandstones, as the grain, being caught in the little cavities of the fixed stone, is immediately reduced to powder by that which revolves. The hardness of this quartz grinding material is such that no part of the stone becomes mixed with the grain, and this quality has obtained for the stones in question a preference over all others used for grinding, so that they have become a

somewhat important branch of export trade to foreign countries; and a few years ago they fetched a very high price, because under the old system of managing mills, stones of very large size were required, and blocks capable of yielding such stones are rare and difficult of extraction. Within about 30 years, however, there have been substituted for stones made of one piece, those which are constructed of several segments cemented together and bound by iron hoops. These segments, to which in France the name of *moulure* has been given, have almost entirely superseded the single millstones, as will be seen by referring to the following table; and it has resulted that this source of industry, while being more fully developed, has yet, for some years past, produced smaller returns than at a former period.

The following table will give an idea of the extent and importance of this manufacture.—

*Condition of the Millstone Trade at La Ferté in 1833.*

| Millstones                                    | P <sup>rs</sup> | Fr. |
|---|-----------------|-----|
| 15 pairs, diameter 6 ft. 1st quality at 1,200 | 18,000          |     |
| 260 " " 2nd " 800                             | 208,000         |     |
| 300 " " 3rd " 600                             | 180,000         |     |
| 300 " " 5 ft. 300                             | 40,000          |     |
| 300 " " 4 ft. 350                             | 105,000         |     |
| 190,000 segments at 3 fr 50c. each            | 681,000         |     |
| Total value in 1833                           | 1,286,000       |     |

*Condition of the Trade in 1849.*

|   |           |
|---|-----------|
| 2,600 stones at an average price of 250 fr. | 325,000   |
| per pair                                    |           |
| 200,000 segments at 3 fr 50 c. each         | 700,000   |
| Total value in 1849                         | 1,025,000 |

The quarries of Tartaret are the most important, the number of workmen constantly employed there exceeding 200. The arrangement of the interstices and solid portions of the stone from these quarries is considered especially favourable for the best mill work, and the stones are almost all regarded as of the finest quality. The working and trade in these millstones is in very few hands, and of these the house of Messrs. Gueuv in Rouhon and Co. is one of the most important. They have sent a very complete collection to the Exhibition, calculated to give a proper appreciation of this branch of industry, and the Jury have awarded to them a Prize Medal.

Honourable Mention is also made of Messrs. GAILLARD (226, p. 1187), and ROGEE (1218, p. 1245), who have exhibited similar objects, but not of such fine quality. The collection they exhibit is also less complete.

COTONNET (150, p. 1245). This exhibitor has also forwarded millstones, but he is not himself a producer, being occupied more particularly in the operation of re-dressing them. When the stones have been so long used that the sharp edges which serve to catch the corn are worn smooth they are put right again at a moderate cost by this exhibitor, who employs in restoring them a machine of great simplicity invented by himself. The Jury have granted Honourable Mention for the double object of his exhibition.

C. LAUVIERRE, slate merchant of Angers (290, p. 1390). The slate quarries of Angers enjoy a high reputation, the produce being conveyed throughout France, wherever the means of transport permit this to be done, at a price not too considerable. Most of the towns in the valleys of the Loire, the Seine, and the Marne are fully roofed by these slates, and the same is the case with several of the coast towns, such as La Rochelle, Rochefort, and Bordeaux. These slates are highly fissile, which allows of their being reduced to a very small thickness, and therefore permits of great lightness in the roofs which have to support them. They contain no pyrites, and, notwithstanding their thinness, are very strong, so that roofs covered with Angers slate are very durable.

The exhibition of Angers slates in London does not do justice to their high character, and without intending to institute a comparison between products of similar kind, the Jury have found it very inferior to that of the Welsh slates. They have, however, made Honourable Mention

of the Angers Slate Company, as represented by M. LAFITTE.

CHAPOT and SELON (448, p. 1200), Viganilliers (Gard).

MARX and Co. (1344, p. 1240), Vigan (Gard). Honourable Mention is made of these two exhibitors from Vigan for their lithographic stones. These, which are obtained from the beds of the upper lias, called *Belgunite marls*, are of very good quality, and since they have been worked, upwards of 12,000 stones per annum have been obtained from them. This experiment, made on a large scale, has proved that the Vigan stone will bear comparison with that from Pappenheim.

M. ALLUAUD, senr (1051, p. 1229), manufacturer of porcelain at Limoges. This manufacturer has added to his exhibition of white porcelain ware the kaolins and pegmatites, which he employs in preparing his porcelain clay and glaze. The manufactured objects exhibited not coming within the range of Class I., it is only for the beauty of the natural productions, and the care taken in working them, that the Jury have awarded Honourable Mention to M. Alluand.

We ought to add, that the kaolin of Limoges has long been regarded as of excellent quality, and that the superiority of the white porcelain of this place, which is largely exported, especially to the United States, is due to the purity of the clay. M. Alluand, senr., is to a great extent the promoter of this important branch of industry by the discovery he has made of considerable deposits of kaolin, which he works, and with which he supplies other porcelain manufacturers.

M. BLOIS, naturalist, of Paris (1397, p. 1263). M. Blois has exhibited 41st. A collection illustrative of agricultural geology. 2nd. A general collection for technological geology. 3rd. Two tables, entitled "Geological Epochs," where all the formations are characterised by the minerals, rocks, and fossils peculiar to them. 4th. A mineralogical collection adapted for travellers, including 1600 specimens, arranged in compartments in two boxes, according to the method adopted by M. DuRoi in his "Traité on Mineralogy;" and 5th. Two small collections of mineralogy and geology, of 150 specimens each, intended for students.

The collection for agricultural geology is intended to illustrate the materials capable of being used for the improvement of soils, and sufficiently abundant to be supplied at prices justifying their employment on a large scale. It contains about fifty such rocks, and M. Bouhée, the author of the collection, states that the most of them are absolutely inexhaustible. Their use is shown by an ingenious contrivance which consists in placing together those rocks which yield soils by degradation, and those which furnish the mineral manures proper for them.

The general collection of technological geology is accompanied by a large synoptical table, which serves at the same time as a catalogue. This table, entitled "Ensemble des Matériaux dont le Globe Terrestre est formé," is prepared by M. Bouhée, whence it results that this geologist is the real author of the collection. It contains in succession the minerals employed for obtaining metals, those used in architecture, hydraulic works, paving, lithography, and other arts in which the raw material is obtained from the mineral kingdom.

The interest presented by this table has induced the Jury thus to make mention of M. Bouhée, although the table is not specially referred to in the Catalogue. They have also made Honourable Mention of M. Bouhée for the whole of his collections; but they have not thought themselves justified in awarding a Medal to him, because the ideas and views illustrated by the collections and by the singular lists of mineral manures have not yet received the sanction of experience; and they feel that in matters which affect such extensive interests, and may have such serious consequences, it is necessary that the result of any proposed improvement should be fully proved before being recommended to the agriculturist.

Ordinary Mentions have been granted to the following exhibitors:—

M. CHENOT (119, p. 1177). Iron and steel produced by means of metallic sponges.

M. Louis FIDLET, of St. Omer (211, p. 184). Various clays for the manufacture of fine and coarse pottery.

M. A. BASTIN (758, p. 1246). A kind of tripoli called "*tellurina*," being a very fine siliceous deposit from the mines of Mayenne, department of the Drôme.

M. FAVREL (855, p. 1256). For the beating of gold leaf.

M. MAEHLI (915, p. 1253). For a model of apparatus for the distillation of oils from schist.

M. SEGUN, marble manufacturer, Rue d'Abbas, Paris (1898, p. 1257). Most of the objects exhibited by M. Segun are sculptured, and the Jury have only taken into consideration the rough marble and sawn or polished slab.

We think it desirable to offer a few remarks on the objects exhibited by M. CHENOT, and on the apparatus of M. MAEHLI for distilling oil from schist.

M. Chenot has endeavoured to solve a very important problem, which has for its object the obtaining of iron directly from the ore without passing through the intermediate condition of pig, as in the Catalonian method, or without being obliged to perform two operations, and smelt the cinder.

To do this, the ore is deoxidised in a closed vessel at a dull red heat by the contact of reducing gas, and there is thus obtained a porous iron described under the name of *metallic sponge*. M. Chenot hopes to be able to bring this into a massive form by simple compression at the usual heat employed in forging, but hitherto his expectations have not been crowned with success, as he would have obtained a much higher reward. The Mention has been made in consideration of the remarkable properties presented by his metallic sponge, which burns with flame at the simple contact of a lighted match, the iron being transformed into oxide. Owing to the facility with which oxidation takes place, the sponges, mixed with certain substances and moistened, form a very solid cement.

The apparatus of M. MAEHLI, for the distillation of oil from schist, consists of a kind of sheet-iron box placed in a muffle, and made to slide along a little railway which extends to the sole of the muffle. In this box are sheet-iron plates, placed horizontally at distances of about four inches apart, and forming a kind of stage, which are intended to receive the schists about to be distilled, and equalize the temperature throughout the retort. The schists are then all exposed to the same current of hot air, and the oil is distilled under similar conditions. It thus results that no part of the schist is calcined before the rest has been exposed to a similar and sufficient heat.

When the distillation is completed, the box full of calcined schist is removed and replaced by another; the inventor considering that this arrangement causes a great saving of fuel, since there is no need to cool the furnace after each operation, as is the case with the ordinary method.

#### ALGIERES (p. 1259).

The investigations carried on in Algiers within the last twelve years by the mining engineers charged with this duty, and by several industrial companies, have proved the existence of a large number of metalliferous localities. The operations conducted at these places are not yet sufficiently complete to ensure profitable returns, although many observations render this result probable.

In 1850 the Government had already granted concessions for eight metal mines, four of which, in the provinces of Constantine, have for their object rich and good iron ores. The difficulty of obtaining fuel in abundance at a moderate price has hitherto been an obstacle in the way of opening these mines with advantage, and only one establishment has been started. This is situated near the concession of Mchoudja, in the neighbourhood of Bône.

The four other concessions, those of Mousaia, Cape Tenés, Oued-Akchab, and Oued-Tafila, are situated in the provinces of Algiers, and have for their object the working of mines of copper and lead.

The mines of Mousaia include three groups of veins, composed of sulphates of barite, carbonate of iron, and grey copper ore. They are situated on the southern side of the first mountains of the Atlas range to the north of

Medeah, and have been worked since 1814, employing 600 persons.

The veins of Cape Tenés are altogether different, the veinstone being a ferriferous dolomite, mixed with beds of clay and ore, consisting of copper pyrites. These veins have been worked for two years, and are remarkable for their great number and for the space over which they spread, a circumstance which renders the preparatory operations very costly. They, as well as those of Mousaia, occur in sandstones and cretaceous clays, which appear to correspond to the *musigno* of Italy.

The mines of La Calle are worked in a fine vein of argentiferous galena mixed with ferruginous clay, the veinstone being quartz. They have been worked with activity for about two years, and have already yielded results of some importance.

The province of Algiers, where these mines are situated, is as barren with regard to supplies of fuel as that of Constantine; but the ores are more valuable, and can readily bear the cost of transport to Europe. There are already two works erected in the neighbourhood of Mousaia for reducing the ores of copper and lead, the rich coal basin of Aïas offering favourable conditions for these establishments, and there is every reason to hope that they will become flourishing in a very short space of time.

In order to show the interest they have felt in the development of the mineral industry of Algeria, the Jury have granted Honourable Mention to—

THE COMPANY OF MINES AND FORGES OF BONE (20, p. 1261), for their forged and cast steel.

And they also award Ordinary Mention to the interesting specimens exhibited by—

M. BLANCHARD DE PHILIPPEVILLE (4, p. 1259). Ores from Mount Tilmah.

MINING COMMISSION OF MOUSAIA (18, p. 1260). Grey copper ore.

MINING COMMISSION OF THE PROVINCE OF ALGIERES, (45, pp. 1261, 1262). Sandy ores of copper, lead, and iron.

MINING COMMISSION OF THE PROVINCE OF CONSTANTINE (46, p. 1262). Geological collection from the province, and sandy ores.

#### STATES OF THE ZOLLVEREIN.

The Zollverein (customs) league includes all those mining districts of Germany which are regarded as classical either by the antiquity of their works, or by the careful attention with which the mining has been carried on. Of these the Hartz in Hanover, Freiberg in Saxony, Silesia, and the Rhenish provinces, are the principal centres. Within this range all the metals are worked, even those being included which are generally most rare, such as mercury and tin; and thus the study of the mineral industry of this part of Germany offers an interest not inferior to that of England, since if, on the one hand, some of the deposits are less rich, the ores, on the other hand, are more varied, so that the metallurgical processes are more complete. Most of these mines are known by numerous and detailed accounts; but perhaps it may not be amiss to recall some facts relative to their products.

The Hartz mines chiefly produce argentiferous galena, and their yield is estimated at upwards of 2,100 tons (42,000 quintals) of lead, and 10,000 lbs. (20,000 mares) of silver, employing more or less directly a population of 30,000 persons. The skill with which they are conducted, the mineralogical and geological studies to which they have given rise, and the advance which they have occasioned in the art of mining, have deserved a high reputation. It was here that machines were first constructed, by Chief Mining-Captain Albert, for lowering and lifting miners; and one of these machines (that at Andreasberg) is employed in a shaft upwards of 1,500 feet deep.

\* The quintal may be calculated as nearly equal to our hundredweight. The metric quintal, however, is equal to 100 kilogrammes, or about 2 cwt., and the ton is, therefore, taken as equal to 20 common quintals, or 10 metric quintals. —I. W.

† The marc of silver is equal to about 8 oz. avoirdupois. —I. W.

The next group of mines, and the most important in respect of the number of veins worked, is that of Saxony Proper, of which Freiberg is the centre, and, if we may so say, the personification. More than 400 metalliferous veins furrow in every direction the northern flanks of the Erzgebirge chain, which forms the eastern boundary of Saxony; and the numerous mines worked on these veins produce on an average 800 tons (8,000 metrical quintals) of lead, 32,500 lbs. (60,000 mares) of silver, and 120 tons (2,400 quintals) of tin per annum. The mining operations are conducted on as large a scale as those of the Hartz; and the mining school rendered illustrious by Werner enjoys a never-dying celebrity.

The Rhenish provinces also present a considerable number of metalliferous localities widely spread over their surface, but capable of being grouped into several well-marked districts. Thus from the neighbourhood of Herberthal, on the left bank of the Rhine, to beyond Brilon on the right bank, the line of contact of the carboniferous limestone and the carbonaceous schists of the coal measures, offer a series of deposits of galena, blende, and calamine, some of which give rise to very active mining operations. The mines near Stolberg placed in these conditions have produced for the last three years from 12 to 14 tons of lead per day, and similar deposits occur near Elberfeld, and Brilon.

The galena is here associated with a large quantity of blende, the abundance of which has long been an obstacle to the prosperity of these mines, but since a method has been discovered of rendering the blende available, as an ore of zinc, it has become an important source of wealth, and the manufacture of zinc from blende is now very successfully carried on. The first works erected on a large scale for this new mode of treatment were placed near Mulheim.

The neighbourhood of Siegen is also one of the most remarkable of the mining district, spathic iron being as abundant in the Stolberg as it is in Styria and Carinthia. This ore is reduced in numerous establishments, whose manufactured iron and steel are equally celebrated. This district also includes veins of grey copper ore, galena, galena, nickel and cobalt ores; and the copper veins of Dillenburg have given birth to a group of small establishments, extremely interesting in a metallurgical point of view.

We must also mention as of great importance the mines of copper in the bituminous schist of Auefeld, where the metals distributed throughout the schist in a manner almost homogeneous over the whole district. This deposit, the only one known of its kind, both in regard to its wide range and the condition of the ore, furnishes more than half the copper produced by all the states of the Zollverein, amounting to 1,200 tons out of 2,000. This production is not equal to the consumption of these countries, as they import in addition from 1,500 to 1,800 tons annually; but it must be added, that they export from 400 to 500 tons in various objects manufactured in copper and brass.

Silesia, concerning which it now remains to say a few words, offers, by the concentration of great operations and large establishments, a character entirely different from that of the other mining districts of the Zollverein. It is the only country in Germany where the manufacture of iron in the English fashion is carried on on a large scale, and it owes this concentration of the iron-works to the existence of a large coal-field in which the ores of iron are abundant. The conditions so favourable to the production of the metal possessed by England are repeated in Silesia; but the coal in this latter country is not bituminous, and yields a coke less fit for the manufacture of iron than the coal of Staffordshire or Wales. From this inferiority of the quality of the coal, the same result obtains in Silesia as in France, namely, that the manufacture of charcoal-iron proceeds parallel with that of iron made as in England, so that it is calculated that, of the 28,000 tons of bar iron produced in Silesia, as much as three-fifths are made in charcoal fires.

The production of pig iron amounts to 40,000 tons (400,000 metrical quintals), upwards of a fourth part of that obtained throughout the state of the Zollverein, which is estimated by M. Von Goldenberg at about 150,000 tons. We have not had the opportunity of verifying these

figures personally; but it is certain that industrial operations connected with iron have made rapid progress in Silesia within the last ten years.

The palaeozoic rocks of Silesia include valuable deposits of calamine very easily worked, and the quantity furnished by this Prussian province is nearly equal to that produced in Belgium. M. Collon, mining engineer, having estimated it as upwards of 20,000 tons (200,000 metrical quintals). These two countries together possess almost a monopoly of zinc for Europe, the total effect of the whole quantity produced in England, Germany, and France, having but very little influence in the commerce of this metal.

The manufacture of zinc in Silesia, as in Belgium, is favoured by the abundance of the coal; the quality of the fuel not being so important in reducing this metal as in manufacturing cast and wrought iron.

Besides the coal basin of Silesia, the Zollverein also possesses other considerable deposits of mineral fuel, one of which, that of the basin of the Ruhr, is little more than the prolongation of a vast carboniferous zone traversing Belgium, and yielding the same qualities of coal. The following statement, taken from the excellent Report by M. Von Goldenberg, on the exhibition which took place at Berlin in 1844, represents with sufficient accuracy the production of coal at that date in the different states of the league:—

|  | Metrical Tons. |
|--|----------------|
| Basin of the Ruhr in Westphalia . . .                            | 1,000,000      |
| “ of Saxony . . .  | 150,000        |
| “ of Bavaria . . .   | 50,000         |
| “ of the Duchy of Hesse . . .                                    | 50,000         |
| “ of Silesia . . .   | 800,000        |
| “ of Saarbrück and the provinces on the banks of the Rhine . . . | 700,000        |
| Total yield . . .  | 2,750,000      |

To complete these notices, we have still to mention the beds of excellent lignite found principally on the Rhine, near Menseberg in Saxon Prussia, at Grunberg in Silesia, and at Lausau near Breslau. The quantity of this material worked is estimated at 2,400,000 tons per annum, and the deposit at Lausau is considered to be the most important of all, producing at this time 1,800,000 tons of a fuel, which serves both for domestic purposes and for manufactures, and is supposed to be capable of yielding annually several hundred thousand tons.

The exhibition of mineral wealth from the states of the Zollverein, now in the Crystal Palace, does not however correspond with the richness and variety of the mines, the principal districts of which we have just now imperfectly indicated. We have already stated, at the commencement of this Report, that the Hartz and Saxony have sent none of their products, and Silesia is indeed the only province represented in a manner at all corresponding to the importance of the subject. From that country there are good specimens, both of its iron and zinc works.

In order to follow more conveniently the enumeration of those objects that have been noticed by the Jury, we will group together those of the same nature, although they are not all rewarded in the same manner. We are indebted for most of the observations that will appear in this part of the Report to notes with which we have been furnished by Mr. Schreiber, member of our Jury from the Zollverein, and we shall begin by recapitulating the two exhibitors who have obtained the Council Medal.

• The first of these Council Medals was granted to Mr. W. GÜTLER (6, p. 1048), of Reichenstein, in Silesia, and Professor PLATTNER, of Freiburg, for the process of separating gold from arsenical pyrites. This process, amply illustrated by the series numbered 6 in the Catalogue, has admitted of the profitable re-opening of the auriferous mines of Reichenstein.

The second is to Mr. KRUPE, of Essen, for fine specimens of steel (649 and 677, pp. 1066, 1067), manufactured by a process peculiar to him.

#### Iron Ores and Bar Iron.

The Jury have awarded two Prize Medals and three Honorable Mentions for this part of the Exhibition. The following have Prize Medals:—

ROYAL IRON FOUNDRY AT MALAPANE, near Offen (2, p. 1047).

Messrs. GIENANTH BROTHERS, forge-masters of Hocheleim, in Rhenish Bavaria (38, p. 1102).

The Royal Iron Foundry at Malapane employ charcoal fuel, and exhibit iron ores, cast and wrought iron, and the slags and cinder collected during various parts of the process. There are also a pair of cylinders of cast iron of great hardness; samples of sheet iron of different thicknesses and length; specimens of red and white calamine from the mines of Scharley; various products obtained in the preparation of zinc in the works in Neuthen in Upper Silesia, especially zinc in ingots and sheets, and oxide of zinc; and a very interesting product obtained at this establishment, viz., metallic cadmium.

These foundries have also a high character in Prussia for the quality of the cast and wrought iron and steel which they manufacture, and the articles exhibited in London fully justify this reputation.

The exhibition sent by Messrs. Gienanth Brothers, consists of merchantable iron, gun-barrel iron, various kinds of sheet iron, iron-ware of different numbers, and steel of various qualities. The products of Messrs. Gienanth are much valued in Germany, the steels being especially in demand (p. 1102).

Honourable Mention has been awarded to—

ROYAL FORGES AT LOHE AND STAHLWERK, near Siegen (324 and 326, p. 1069).

Spathic iron, lamellar white pig, natural steel, and forged steel.

J. HAHNLOCK, of Crombach, near Siegen (154, p. 1076). Ores of iron from the mines of Musen, with specimens of forged and refined steel.

J. H. DAVSLEM, sen., of Siegen (449, p. 1075). Ore of iron from Hohegrothe, Peterbach, St. Andre, and Huth Mines, situated in the neighbourhood of Hamm. White laminated pig, refined iron, and bar iron.

#### Natural Steel, Blistered Steel, and Cast Steel.

The manufacture of steel is very actively carried on in the states of the Zollverein, as it is calculated that out of 21,000 tons (210,000 met. quintals) furnished by the whole of Germany, their proportion amounts to 8,000 tons, that of Austria being 13,000. The abundance of the ores of spathic iron, resembling those of Syria and Carinthia, has had the same effect as in those two states of Austria, in inducing a great development in the manufacture of natural steel, while the converted or blistered steel is the exceptional form, the latter being more difficult to work than the natural steel, and both being obtained in Germany at about the same price. The cast-steel works are of some importance; and we have noticed the important results obtained in this manufacture by Mr. Krupp, of Essen.

Among the establishments who have exhibited materials of this kind the Jury notice four, and to two of these Prize Medals have been awarded:—

LEHRKIND, FALKENROTH, and Co., of Hagen, near Hagen (447, p. 1075), who have exhibited ingots of cast steel, and forged steel of various kinds.

HUTN and Co., of Hagen (632, p. 1085), who have also exhibited steel in its various forms of blistered, forged, and cast.

And Honourable Mention has been awarded to—

Mr. VORSTER, of Lippe, near Hagen (448, p. 1075).

Messrs. BOHME, ROHM, and LEISKY, of Limburg (453, p. 1076).

The steels exhibited by Messrs. Lehrkind and Co., of Hagen, have been obtained by a peculiar method in the puddling furnace. According to Mr. Schreiber, their price is lower than that of other German steels, being sold at 22 $\frac{1}{2}$  per ton. It would seem that similar attempts have been made in other works, but without success.

Mr. Vorster, of Lippe, has obtained malleable iron and steel directly from the pig.

The difference made between these four exhibitors is the result of an examination of the objects exhibited, and not a comparison of the relative importance of the establishments, and the quality of their products.

#### Ores of Lead and Metallic Lead.

ESCHWEILER MINING COMPANY, in Stolberg (818, p. 1008).

A Prize Medal has been awarded to this Company for the detailed exhibition it has made of the products of its mines and foundries. These consist of ores of lead and zinc from the mines of Dieppen Kirchen and Breiniger Berg, near Aix-la-Chapelle, of Bleiberg, between Cologne and Siegen, and of Kl. Kfeld and Heidenchen, near Aix-la-Chapelle. They also include pigs of lead and zinc, and a cake of silver obtained at the foundries of Hirschenfang and Binsfeldhammer, near Stolberg.

Honourable Mention is awarded to the following:—

E. F. OHLE (Heirs of), of Breslau (62, p. 1052), who exhibit lead pipe of various calibre, sheet lead, and lead wire.

MEINERZHAAGEN and KREUZER BROTHERS, of Meckenech and Commern (316, p. 1068), who exhibit lead ores from the mines of the Count Julius, of Lippe, and Messrs. Kreuzer Brothers, besides pig and sheet lead.

#### Zinc and Cadmium.

The production of zinc is well represented in the Exhibition, and the Jury have awarded to this branch of industry three Prize Medals and two Ordinary Mentions.

ROYAL IRON FOUNDRY AT KONIGSHUTTE (3, p. 1048). A Prize Medal for ores of zinc, metallic zinc, and metallic cadmium.

RITTER and Co., of Breslau (11, p. 1048). An assortment of sheet zinc, two samples being as thin as paper, and remarkable for their style of execution. Sheet zinc for roofing. Also a Prize Medal.

C. ROHARZ and Co., Mulheim on Ruhr (452, p. 1076). A Prize Medal for specimens of zinc ores from different mines, and for manufactured zinc of fine quality.

Ordinary Mention to Messrs. BUNING and Co., of Stolberg (31, p. 1068), for zinc and lead ores, including some rare ones, such as Wilhemite, chloro-phosphate of lead, and crystalline carbonate of lead; and also to Mr. ULLMANN, of Cologne (322, p. 1069), for calamine from the mines of St. Margaret and St. Joseph, near Mulheim, on the banks of the Rhine.

#### Copper.

The working of copper is exclusively represented by the combined MINING WORKS OF MANSFELD, 860, p. 1096). Besides treating the cupiferous schists for copper, they also separate the silver that is mixed with the metal, and this separation, formerly effected by liquidation, is now performed by a new process, concerning which no information has been given to the Jury. The Jury have recognized the value of the result, and have awarded a Prize Medal to the establishment at Mansfeld.

#### Cobalt.

P. GRAAF, of Siegen (592, p. 1083). The exhibition of cobalt is only made by this exhibitor. The ore which he works is from Hofnung, near Siegen, and consists of minute microscopic crystals disseminated in an argillaceous and quartz schist. The ore does not yield more than 2 to 3 per cent of metal; and the method adopted in working, as described to the Jury by M. Schreiber, is extremely perfect, not more than two parts in a million of cobalt being lost. Honourable Mention is awarded to Mr. Graaf.

#### Manganese.

The ores of manganese are chiefly employed in the manufacture of chlorine and the chlorides, and do not therefore undergo any metallurgical preparation; so that the care with which the working is conducted and the picking of the ore are the only matters that the Jury can reward. They have been able, therefore, to grant nothing more than Ordinary Mentions for this branch of industry, and these have been awarded to two Prussian and two Nassau exhibitors as follows:—

Mr. J. BIRGER, of Blessen, near St. Wendel (311, p. 1068). Manganese in crystalline masses and in powder, prepared for the manufacture of chlorides.

Mr. J. H. HERRMANN, of Limmen. Manganese, crystallised, in fine specimens, and massive.

Messrs. ROSSMANN and Co., of Giessen (Hesse) (2, p. 1125). Oxide of manganese, in very fine crystals; a very pure ore.

Messrs. W. BÄREL and Co., Giessen (4, p. 1125). Similar ores in crystals, less perfect.

#### *Coal, Coke, Lignite, and Bitumen.*

The details given at the commencement of this part of the Report have established the importance of the coal basins and beds of lignite, and we have only here to add that the deposits of the latter fuel belong exclusively to the tertiary period.

Among the small number of persons who have exhibited products of this kind, the Jury have made Ordinary Mention of the following three:—

Mr. H. A. BRUNKE, of Mülheim on the Ruhr (448, p. 1075). Coal and coke of great purity, from the mine of St. Victoire Mathias.

Mr. F. HANIEL, of Ruhrort on the Ruhr (455, p. 1076). Coal of different qualities from the mines of Heinrich, Steingalt, Hagenback, Sälzer, and Neuack. Coke manufactured from the coals of the three last mines.

Messrs. A. WISMAN and Co., of Augustenhütte, near Bonn (334, p. 1070). Bitumen, mineral oil, dussodyle, and various products obtained from the distillation of bitumen.

#### *Amber.*

Amber is found associated with certain lignites, and is tolerably abundant, but transparent specimens of fine colour are rare, Prussia being almost the only country by which they are furnished for commercial purposes. They are collected chiefly in the environs of Königsberg and Memel, on the shores of the Baltic, and according to the rules established by the Jury, they ought not, perhaps, to grant rewards for this material. Considering, however, that a certain degree of intelligence is required in collecting it, and selecting the pieces proper for cutting, Honourable Mention has been granted to Nos. 40, 438, and 441.

D. F. TESSLER, of Stolp (40, p. 1050). Two very fine specimens of rough amber; and a third specimen containing insects.

W. MANNHEIMER, of Königsberg (438, p. 1075). Two specimens of amber, weighing respectively 6 lbs. and 4½ lbs., remarkable for their large size and purity.

W. VON ROX, of Dantzig (441, p. 1075). A fine collection of amber, differing in colour, brilliancy, and transparency. The exhibitor has been 25 years making his collection, and the rough specimens are accompanied by manufactured articles, several of which are of great value.

#### *Working of Salt Mines and Purification of Salt.*

In most of the states dependent on the Zollverein, salt is obtained from the evaporation of saline springs. The trade is not open, the salt-works being conducted by the Government. The Jury have granted the following Ordinary Mentions:—

ROYAL PRUSSIAN SALT-WORKS OF DUNZBURG (445, p. 1075). The collection sent by this establishment consists of impure and prepared salt, of various degrees of fineness.

SALT-WORKS OF SALSBAUSEN, in the Grand Duchy of Hesse (3, p. 1125). Common salt, purified salt, lignite and bituminous wood employed in the evaporation of the brine; various products of the salt-works.

SALT-WORKS OF THEODORSHALLE AND KREUZNACH (Hesse 5, pp. 1125, 1126). Salt in grains; crystallized salt, remarkable for the size of the crystals. Concentrated mother-liquor, containing iodine, bromine, and chloride of calcium.

#### *Millstones, Marbles, and Refractory Clays.*

Ed. LANDAU, of Andernach (321, p. 1069). Lavas possess the property of enduring up to a certain point,

\* This Exhibitor has been awarded an Honourable Mention by the Jury of Class XXVII, in whose List his name appears.—J. W.

being vesicular and hard, and their application in this way may be productive of very good results.

The Jury, guided by this consideration, have granted a Prize Medal to Mr. Landau, who has exhibited excellent lava millstones from Niedermendig, near Andernach. These stones, of which the dimensions vary from 18 inches to 6 feet in diameter, may be employed for grinding corn, preparing oil, and for all similar purposes.

F. ZELLER, of Neckar-Tenzlingen, near Stuttgart, Wurtemberg (1, p. 1114). Specimens of stone from Mr. Zeller's quarries, arranged for the manufacture of millstones. According to their different conditions of hardness, grain, and colour, these millstones are employed for grinding wheat or other grain. Honourable Mention is made of Mr. Zeller for this interesting manufacture.

The COUNSELLOR VON MINUTOLI, of Liegnitz (191, p. 1058). Amongst numerous objects of antiquity and architectural decoration, this gentleman has exhibited some very fine marbles of Silesia, for which the Jury have awarded an Ordinary Mention.

M. DE MULMANN, of Zeche Plato, near Siegburg (319, p. 1018). Refractory clay, refractory bricks for lining the interior of blast furnaces, and crucibles for steel casting. The crucibles are considered by Mr. Schreiber to be of good quality, and they are made of the same clay as the bricks, to which, however, is added graphite from Bavaria.

Messrs. KAPPELLER and Son, of Hafnerzell, near Passau (28, p. 1099). The reputation of the plumbago crucibles of Bavaria has been long established, and they were considered, till lately, as the only ones that could compete with those employed in the steel-works of Sheffield, and manufactured of Stourbridge clay. These crucibles owe their superiority to a mixture of plumbago, which modifies the dilatation and contraction of the material of the crucibles when they are exposed to the high temperature of the steel furnaces, or withdrawn to pour out the steel.

The crucibles of Messrs. Kapeller are of very different size, and we have noticed some 2 feet high and about 20 inches in diameter. According to their dimensions, and perhaps also the preparation of the clay, these crucibles are employed for fusing silver, gold, or steel.

A Prize Medal is granted to Messrs. KAPPELLER for the excellent manufacture of their crucibles.

#### *Geological Maps and Collections.*

Geological maps and collections are properly regarded as a means of spreading geological knowledge, and favouring the development of mineral industry. These considerations have induced the Jury to grant a Prize Medal and two Honourable Mentions for different geological maps, published by several editors in different German states, although these editors have in no degree participated in the investigations made in preparing these maps.

The Prize Medal has been awarded to Messrs. JONCHAU and VENATOR, booksellers of Darmstadt, for their beautiful relief maps:—1. Of the Grand Duchy of Hesse, and the Grand Duchy of Nassau, executed by M. Ewald, Secretary of the Geographical Society of Darmstadt. 2. Of Wurtemberg, Baden, and the countries surrounding the Palatinate and Alsace. These maps are part of the exhibition of Hesse (6, p. 1126).

Honourable Mention is made of T. DICKERT, of Bonn (432, p. 1074), who has prepared relief geological maps of the Siebengebirge, the Valley of the Rhine, and Vesuvius; and also of Messrs. SCHROFF and SIMON, of Berlin (309), who have published a coloured lithographic series of geological maps.

MINERALOGICAL and METALLURGICAL COLLECTION of the Duchy of Nassau, collected and exhibited by the GOVERNMENT ENGINEERS of Mines (Nassau, 1 to 5, p. 1031).

\* These Exhibitors have been awarded a Prize Medal by the Jury of Class XXVII, in whose List their names appear.—J. W.

The interest possessed by this collection, which includes the useful minerals and the different rocks of Nassau, and the productions of the most important mining establishments, has induced the Jury to award a Prize Medal to the Exhibitors.

We do not repeat the names of the minerals and rocks contained in this fine collection, and merely refer to the establishments which have assisted to form it. These are as follows:—

M. LOSSEN, IRON FOUNDRY OF MICHELBACH (2, p. 1132), to whom the Jury awarded an Honourable Mention.

ISABELLENHUTTE SMELTING WORKS near DILLENBURG (3, p. 1132).

In this establishment, partly devoted to the preparation of nickel, arsenic is also obtained, and various alloys are manufactured, especially German silver, composed of 8 parts copper, 3 nickel, and  $\frac{3}{4}$  zinc.

MARBLE MANUFACTORY OF DIEZ (5, p. 1132). The marbles of Nassau, worked in this establishment, all belong to the palæozoic rocks. They include fine black varieties, and others which are red, yellow, and grey.

#### GREECE (p. 1400).

The GREEK GOVERNMENT has sent for exhibition a series of specimens of minerals and rocks, marked in the Catalogue with the numbers 15 to 50 (p. 1400). This collection, grouped according to the provinces, chiefly includes a fine series of marbles and materials for construction, obtained for the most part from the cretaceous limestones, either compact or crystalline.

We notice also puzzuolanas from Santorin, emery from Naxos, meerschaums from the environs of Thebes, and lithographic stones from Messina. The latter are of even grain, and appear to be of good quality.

The Jury wish to make Honourable Mention of the GREEK GOVERNMENT (pp. 1405, 1406), on account of the interest presented by the series of marbles, as well as for the discovery of lithographic stone in that country, and also of MILO (15, p. 1402) for samples of scatite (the soapstone, or French chalk of commerce).

#### NEW GRANADA (p. 1430).

E. PARIS, of Bogota (p. 1430), has exhibited very fine emeralds from the Muzo mines, which supply almost all the precious stones of this kind imported into Europe. These emeralds, which are all crystallized, are attached to the parent rock, and thus possess a geological interest. An Honourable Mention has been awarded to Mr. PARIS.

#### PORTUGAL (p. 1306).

Among the objects sent to London by Portugal a large number of specimens of marbles may be noticed. There are two excellent series of these, the one exhibited by Mr. J. de Figueiredo (120 to 231, pp. 1309, 1310), and the other by Mr. Déjeant (232 to 257, p. 1310). All the specimens are in squared or rounded slabs, and polished. The colours are very varied, white, and dark grey predominating; but there are also fine yellow and deep and beautiful violet tints. Almost all the marbles are crystalline; but one amongst them is a very fine round slab, with specimens of "*Chama ammonia*," in which the shell is preserved. These fossils, which are of a deep-grey colour, stand out from the marble, which is of a yellowish grey; and it is interesting to see them thus completely preserved in a limestone of which the crystalline condition is so decided. The Jury have desired, as a matter of geological interest, to learn whence these marbles have been obtained; but the localities are not indicated on the specimens, and the person in charge of the Portuguese exhibition has not been able to give any assistance in this respect.

Mr. Déjeant has also exhibited (110, 111, 115, p. 1309) lithographic stones of even grain and very compact. Similar stones are sent by the Duke of Palmella, and also by the Royal Tobacco Contractors.

Honourable Mentions have been granted to the DUKE OF PALMELLA, Mr. DÉJEANT, Mr. DE FIGUEIREDO, and to the ROYAL TOBACCO CONTRACTORS (p. 1309), for the

objects just described. Also to Mr. M. A. DA SILVA, (p. 1316), for the manufacture of lead for shot, of which he exhibits a fine series (991 and 1014), and to the PROPRIETORS OF THE MINES OF BRACAL (1295, p. 1318), for specimens of lead ore and manufactured lead.

#### ROME (p. 1235).

The Roman States have sent to the Exhibition a tolerably large number of manufactured articles, but only five or six persons have exhibited the productions of the mineral kingdom. Of this small number the Jury have given Ordinary Mention to two, viz., the COENT BIANCONCINI (1, p. 1285), who has forwarded perfectly pure quartz, sand, and other materials used in the manufacture of glass; and MESSRS. PARQUAT and DOMENICO RINALDI (2, p. 1285), who send a collection of native asphalt, and the products of purification of this bituminous mineral.

#### RUSSIA (p. 1361).

The gold mines of Russia have yielded for some years past a revenue of nearly four millions sterling; but as their working consists of mere stamping and washing, the latter offering few difficulties on account of the high specific gravity of the metal, this important source of riches to the country has little interest for science. On the other hand, the working of iron affords great variety in the methods of proceeding, requires powerful machinery, and its manufacture, joined to the working of copper, forms the principal part of the mineral industry of Russia. This fact has produced its effect in that part of the Exhibition from Russia coming under the cognizance of this Jury, which is, indeed, to a great extent, confined to the objects sent from the iron-works, and chiefly those of the Government, namely:—

THE IMPERIAL FORGES OF ALEXANDER, at St. Petersburg.

THE IMPERIAL FOUNDRIES, for Cannon, at Ololetz.

THE IMPERIAL STEEL-WORKS OF ZLATAOUST.

THE IMPERIAL FORGES OF KOUSSHYNSK, of GORODNODATSK, and of KAMENSK, situated in the Government of Perm.

THE IMPERIAL ESTABLISHMENTS OF NIJNE-TOURINSK, VERKHNE-BARANTCHINSK, and VERKHNE-TOURINSK.

THE MANUFACTORY OF ARMS, of ZLATAOUST, TATKINSK, and TONISK.

These works are supplied by metalliferous deposits, which are remarkable at once for the abundance and the excellent quality of the ores. In this respect we may mention, as of the first importance, the celebrated deposits of magnetic iron ores of Gorodnogradsk, which yield the ores used by the works numbered 1, 7, 10, 11, and 12 (p. 1362, 1364, 1365), in the Catalogue.

Among the principal articles obtained by the fusion of these ores in the imperial establishments, we may mention, as having principally attracted the attention of the Jury, the castings for cannon, and the projectiles from the works at Ololetz, the fine hammered and rolled irons of Verkhne-Nijne-Tourinsk, Verkhne-Barantchinsk, and different forges dependent on the group of Zlataoust.

Several remarkable productions prove that Russia now prepares, with success, for its own consumption, the metals which it formerly exported in the unmanufactured state to foreign countries. Among these we may mention drawn, shear, and rolled steel, from the works at Zlataoust.

A scientific supervision has been exercised in the formation of these collections, which represent the operations of the different establishments we have mentioned. The Jury have remarked with interest the series of minerals and rocks accompanying the principal ores of the Ural and the Altai, and have wished to reward the care with which the collections have been prepared by granting a Prize Medal to each of the persons charged with their preparation. Since, however, all the establishments have been described as "Imperial," it has only been possible to award one Prize Medal to the RUSSIAN GOVERNMENT for the whole of this interesting exhibition.

Among the establishments not belonging to the Government which have sent samples of their productions to London, the Jury have remarked particularly the

forges of Khamounitsky Viatka, belonging to Madame PONOMAREFF (19, p. 1366). A Prize Medal has been granted to this lady for the manufacture of the sheet iron described as oxidised, a product remarkable for the evenness with which it is rolled, its tenacity, and the brilliancy of the surface.

A Prize Medal has also been granted to Messrs. DEMIDOFF, of Nijne-Tagilsk, in Siberia, (pp. 1377, 1378), for their collection of gold and platinum washings. To the auriferous sands in the state in which they are found, and in different stages of preparation, as well as scales of gold obtained by washing, these exhibitors have added specimens of the containing rock, and of the rocks found as boulders or pebbles in the auriferous alluvium. This interesting series furnishes, therefore, a complete history of the kind of deposit it illustrates.

Lastly, there are Honourable Mentions made of Messrs. A. and M. PARINOFF, of Orenburgh (23 and 24, p. 1367), who have respectively exhibited copper in ingots and also of the Imperial mines of Poland (15, p. 1366), for the fine specimens of the metallic cadmium exhibited. This metal is obtained in large quantities from the common zinc ore of the district, and is sent into the market at a price sufficiently low to induce, probably, a more extended economic application of it.

#### SARDINIA (p. 1302).

From this country the exhibition of mineral produce is but small and unimportant; the awards of the Jury have consequently been limited to Honourable Mention to the following exhibitors:—

F. GRANGE, of Randens, near Aiguebelle, Savoy (1, p. 1302), for spathic iron ores from the mines of St. Georges des Hurfieres.

S. ZOLEST, Chiavari (2, p. 1302), for specimens of slates, rough for roofing purposes, and also seen and planed for internal fittings.

D. PIANELLO, Chiavari (3, p. 1302), for a fine slab of slate, 5 feet 6 inches square.

#### SPAIN (p. 1320).

We feel some difficulty in speaking of the objects in our class from this country, which is, however, one of the most favoured by nature, in regard to the sources of mineral wealth. Thus Spain possesses vast deposits of coal in the Asturias, and in the province of Leon; its mines of salt at Cordova are as rich and as extensive as those of Wieliczka; ores of iron exist in abundance in all its provinces, and the lead mines of the Sierras, of Gader, and Almagrera, are richer than any that are known. It shares also, with the mines of Idria, the monopoly of the trade in quicksilver throughout the world; and yet notwithstanding all this, almost the whole of the mineral collections sent to the Exhibition might be kept in a single drawer. The specimens which compose this series are also small, many of them badly selected, and almost all of them badly preserved.

The only rewards that the Jury have been able to give have no reference to the important mines of which we have just given a very summary enumeration. They belong to the objects of secondary importance in the mining industry of Spain.

One Prize Medal has been awarded to the LEONESA-ASTURIAN Company (21, p. 1330), which has exhibited steel of excellent quality.

Four Honourable Mentions have been granted, viz.—

D. JUAN GILÓ, of Malaga (23, p. 1330), for the manufacture of cast and wrought iron, in his same establishment, called "El Angel."

The Province of COORDOVA (29, p. 1330);

The Province of SARAGOSA (32, p. 1330); and

The ROYAL LITHARY OF MADRID (31, p. 1331), for the series of marbles exhibited by them.

#### SWEDEN AND NORWAY (pp. 1346).

The working of mines, and the production of metals, form a very active branch of industry in Sweden and Norway; the soil of these countries, derived for the most part from old rocks, and the severe climate of the north, being natural causes giving a great preponderance to mineral industry.

The working of copper, silver, and lead, is there very active, but the ores of copper are generally poor, seldom averaging more than about four per cent. when prepared for smelting, while some are worked which hardly yield so much as two per cent. These coppers are, however, much valued in commerce, on account of the ores containing neither arsenic nor antimony; and the annual supply amounts to 1,500 tons, of which the celebrated mine at Fahlun yields more than half.

The mines of lead would be of no value if it were not for the silver the ores contain.

The mines of Sala are the most important in respect to these metals, and it is estimated that they yield seven-eighths of all the silver produced in Sweden; for, although it is the custom to regard the celebrated Kongsberg mine as of the first importance in the production of silver, its yield varies so greatly as to diminish considerably its value in an industrial sense. In fact, after being frequently abandoned, on successive attempts, and after having shown a deficit of more than 80,000*l.* between 1815 and 1830, there were found parties sufficiently rich to undertake the working once more; and between the years 1830 to 1840 they have, after paying the deficit, shown a clear profit of upwards of 440,000*l.*, with a staff of 110 miners.

The cobalt mines of Skuterad, in the parish of Modum, in Norway, and those of Tunaberg in Sweden, have yielded considerable profits; but we are not aware of the exact amount.

But, however important the mines of copper, silver, lead, and cobalt may be when taken together, they are but trifles compared with the products of the iron mines, which form, both in Sweden and Norway, a very prosperous branch of industry, especially by their intimate bearing on the cultivation of the forests.

The iron ores of Scandinavia consist of magnetic iron ore, mingled accidentally with specular ore, and their average yield is as much as 46 per cent. The most celebrated are those of Dannemora, Utö, near Taberg, Nora, and Phillipstad; but the mines of Gellivara are also very rich, although the difficulty of communication is such, that the produce from them does not exceed 1,500 tons; the total production of the country being 133,500 tons.

The reputation of Swedish iron is sufficiently established to make it unnecessary to do more than mention its extraordinary fitness for the manufacture of steel; but the quality in this respect being unquestionable, it might be supposed that all deposits of magnetic oxide would be equally adapted to the manufacture of iron for the same purpose. This opinion has not been verified by facts, for numerous experiments, repeated both in England and France, have recently shown that the Swedish is preferable to all others, when it is desired to manufacture cast steel of the finest quality. Even in Sweden there are essential differences between the different mines, which exist also in the different parts of the deposit at Dannemora, which mine alone yields the iron that is of the highest excellence.

Up to the present time, the causes of this superiority have escaped all investigation. The magnetic iron ore everywhere presents similar characters, except that the grain is more or less fine; but the chemical composition is frequently the same. There are, therefore, shades of difference of extreme delicacy which mark the finer kinds, but these may, probably, long remain a mystery to science. The best iron is produced at the forges supplied from that part of the deposit called the 'Middle Field,' or the 'Great Mine,' and the peculiarities of the ore are so persistent, that all the iron of the same mark usually presents with very great uniformity, and to the same extent, the steel property.

This superiority of certain establishments over others, established by long experience, would have been sufficient to class the iron sent by Sweden for exhibition, if the Jury had had to award prizes only according to the quality of the iron; but they had also to examine the modifications of the methods adopted, and the care and attention shown in preparing the different objects for exhibition. As far as Sweden is concerned, the difference of awards is almost entirely the result of the Exhibition, &c.

for even the inferior kinds of Swedish iron are of a quality very superior, when compared with the iron from other countries.

There have been awarded, for this branch of industry, one Prize Medal, two Honourable Mentions, and three Ordinary Mentions: and we proceed to enumerate the establishments which have obtained them, in the order of the award.

**FORGES OF MOTALA** (6, p. 1349). Iron ores, cast iron, puddled iron, bar iron, steel, and the slags and cinder of the different operations.—A Prize Medal.

**C. A. RETTIG**, of Gelle and Kihlaforss (2, p. 1349). Ores from the Hammerin mines, in the district of Roslagen, near Stockholm, cast iron, wrought iron, and steel.

**MR. TRASSHOW**, of Laurvig and Fritze, Norway (36, p. 1352). Bar iron; several pieces twisted cold into knots.

To both of whom Honourable Mention is awarded; and Ordinary Mention to the following exhibitors:—

**T. LAGERHJELM**, of Christinelmann and Bufors, Sweden (1, p. 1348).

**FORGES OF HELLERFORS**, Sweden (4, p. 1349).

**J. FLOOD**, of Perskund, Sweden (7, p. 1349).

**Silver and Lead**.—We have already stated, at the commencement of this Report, that the celebrated mine of Kongsberg had sent for exhibition specimens of ore remarkable for their large dimensions, and the beauty of the crystals of native silver ore. This establishment, which belongs to the Swedish Government, has completed the collection from this mine by specimens of silver in different states, and of the rocks which constitute the formation in which the veins occur. A Prize Medal has been awarded, for this interesting and instructive series, to the KONGSBERG SILVER WORKS (34, p. 1352).

The **MINES OF GULDMEDESHYTAN** (16, p. 1350), sending argentiferous lead, have received Honourable Mention.

**ORES OF COBALT AND CHROME**.—The **TUNABERG COBALT WORKS** (9, p. 1350) furnish the richest and purest cobalt ores of Scandinavia, and Honourable Mention has been awarded for the objects exhibited from this establishment, including the products obtained in working, and the various operations which the ore is made to undergo, in order to obtain from it the oxide of cobalt.

**C. H. GARMANN**, of Drontheim, in Norway (38, p. 1352).—Chrome iron, raw and purified. This ore of chrome is much mixed with the veinstone. In order to purify it, the ore is pounded in a stamping machine, and separated mechanically in the usual way.

The Jury have awarded an Ordinary Mention to **MR. GARMANN** for this application of the method practised in separating lead ores, to the preparation of the ores of chromate of iron.

#### SWITZERLAND (p. 1264).

For some years past, the manufacture of steel has had a certain development in the Swiss Cantons: several establishments having been started successively at Bienne, Neuchâtel, and Schaffhausen. The products exhibited in London have been recognised as of very good quality: the steel for springs being especially remarkable for its elasticity, and the resistance it offers to fracture.

Two Prize Medals have been granted for the products exhibited by Switzerland, numbered 1 (p. 1265), and 41 (p. 1269), respectively.

**MESSRS. NEUKAUS AND BLÜSCH**, of Bienne (1, p. 1269).—Bar steel and steel wire, for the manufacture of rope.

**MESSRS. MATHEY AND SONS**, of Locle, in the Canton of Neuchâtel (41, p. 1269).—Bar steel, rolled steel for making springs and steel cylinders, used in the manufacture.

And Honourable Mention to **J. C. FISCHER**, of Schaffhausen (47, p. 1269).—Ingots of steel, called 'meteoric steel,' bars of steel of different numbers, and various instruments manufactured with this steel.

**MR. FISCHER** has added to his exhibition a drawing representing the interior of his establishment, from which it appears, that the smelting furnaces are very small, and may be conveyed from one place to another without any

other expense than that incurred by the removal of the bellows. **MR. FISCHER** states, that he manufactures cast steel by a peculiar method; but the drawing, the only document the Jury are enabled to refer to, does not indicate any difference between his method of melting and those already known, except in the small scale on which the operation is carried on.

#### TUSCANY (p. 1289).

The exhibition from Tuscany is very interesting in a mineralogical point of view, the Royal Technological Institution having sent a very fine collection of minerals, including a magnificent series of marbles and alabaster, and superb specimens of the numerous minerals found in the Isle of Elba. Amongst these we may mention once more a block of gneiss, covered with noble crystals of felspar, already noticed at the commencement of this Report; \* crystals of tourmaline, remarkable for the purity of their forms and the variety of their colours; aquamarines; and crystals of jenet. The useful ores, also, have been included, and we find specimens of specular iron ore, galena, and the ores of copper.

We have observed two blocks of mineral fuel (16-inch cubes) apparently of good quality. It is probable that this mineral belongs to the lignite deposits of Monte Massi and Monte Bamboli, which the Reporter has had the opportunity of visiting, and which agree with the lignites of Aix, the superposition of the bed which contains the lignite (itself about a yard thick) upon the *M. cigno* being very certain, notwithstanding that the quality and general condition of the fuel present all the appearances of true coal, and that it yields a coke. Although there is no positive mention of the locality attached to the specimens, we take it for granted that they proceed from this deposit; but we wish, at the same time, to direct attention to the impressions of ferns and calamites, placed near them, no doubt by mistake; for these latter are certainly of the carboniferous period, although no vestiges of the coal formation exist, either in Tuscany, or in any other part of the chain of the Apennines.

Of this fact the Reporter was aware from his own investigations, and these have been completely confirmed by the interesting work just published by Professor Paolo Savi, in conjunction with **MR. E. MENECHINI**.

The Jury, considering the high mineralogical interest of this collection, have awarded a Prize Medal to the **ROYAL TECHNOLOGICAL INSTITUTE OF TUSCANY** (p. 1290).

A Prize Medal has also been granted to the **ROYAL SALT MINES** of Volterra (2, p. 1290), which has sent for exhibition specimens of salt obtained from the evaporation of brine, besides specimens of alum and sulphur from the same establishment.

Ordinary Mention has been granted to the exhibition of the ores of mercury of **LEVIGLIANI RIPA**, in the province of Pietra Santa; and of **YANE**, **Castellazzara**, and **Capita**, in the province of Volterra; numbered respectively, 7, 8, 9, 10, and 11 in the Catalogue (pp. 1290, 1294).

#### TURKEY (1385).

The mineral exhibition of Turkey is represented by a collection of upwards of 200 specimens, sent by the Ottoman Government. It was but just unpacked when the Jury separated, and the specimens were labelled only in the Turkish language, with which none of the members of the Jury were acquainted, so that it is impossible for them to state the precise value of the collection. It appeared, however, to be of some importance by the variety of the metalliferous ores included, the principal of them being red hematite, in fine kidney-shaped nodules, lead ores, accompanied by metallic lead obtained from them, and rather rich copper pyrites. But that which has chiefly interested us, and requires especial notice in this place, is the presence of 20 or 30 specimens of very good coal; and the person in charge of the collection having had the kindness to translate for us the labels, we are enabled to state the localities whence they were obtained.

\* These Exhibitors have been awarded a Prize Medal by the Jury of Class XXII., in whose List their names appear.—I. W.

\* See ante, p. 8.

† *Considerazioni sulle Geologia della Toscana*, dei Professori Cav. Paolo Savi e G. Menechini; Firenze 1851.

All of these localities are distributed over a range of upwards of 40 leagues along the shores of the Black Sea, the Sea of Marmora, and the Archipelago, whence it appears that the coal formation must have a wide distribution in this part of the Turkish empire. The names of the places, beginning from the East, are as follows:—Amasra and Erekli, on the Black Sea; Vivan on the Sea of Marmora; and Scala Nova, in the Archipelago, about 40 miles from Smyrna. There are also in the collection three specimens from Rodosto, in the Roumelia, 28 or 30 leagues west of Constantinople: so that if the indication of these localities may be depended on, the coal formation must exist on both sides of the Straits; but according to a geological collection from the shores of Amasserah and Erekli, collected in 1844, and depo-

sited in the Ecole des Mines, in Paris, by M. de Chancourtoi, Mining Engineer, there is reason to doubt whether the mineral fuel from the shores of the Black Sea (Anatolia) belongs to a true coal formation; and it is possible that the deposit is as modern as the cretaceous period. However this may be, and although it is possible that mistakes may have arisen by confusing the place of production with the port of embarkation, it appears, at any rate, quite certain that Turkey possesses, at a small distance from the capital, and even on the channel of Constantinople, a considerable coal-field, which may become an important source of wealth in the development of its industry, and for the purposes of steam navigation.

*Paris, October 1, 1851.*

DUFRENOY, REPORTER.

## CLASS II.

## REPORT ON CHEMICAL AND PHARMACEUTICAL PROCESSES AND PRODUCTS GENERALLY.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

## Jury.

J. DI MAS, *Chairman*, France; former Minister of Agriculture and Commerce, Member of the Institute, &c.  
 T. GRAHAM, F.R.S., *Deputy Chairman and Reporter*, 4 Gordon Square; Prof. of Chemistry, Univ. Col.  
 JACOB BELL, M.P., 55 Langham Place; Pharmaceutist.  
 MICHELE GALEANI, M.D., Sicily; Doctor of Medicine.  
 GEORGE GOSSLETH, Austria; Chemical Manufacturer.  
 JOHN MERCER, F.C.S., Oakenshaw, near Accrington, Lancashire; Calico-Printer.  
 H. L. PATTINSON, F.C.S., 10 Grey Street, Newcastle-on-Tyne; Chemical Manufacturer.  
 DR. VARIENTRAPP, Zollverein; Professor of Chemistry.

## Associates.

T. ANDERSON, M.D., F.R.S., Edinburgh; Chemist to the Highland and Agricultural Society of Scotland.  
 — BALARD, France; Member of the Institute, &c., &c. (Juror in Class XXVIII.)  
 L. L. BONAPARTE, France; Member of the National Assembly.  
 WILLIAM LINTON, 7 Lodge Place, St. John's Wood; Artist.  
 A. PATES, France; Member of the Institute, Professor at the Conservatory of Arts and Sciences, Member of the Central Jury, &c. (Juror in Class IV.)  
 EUGENE PELAGOT, France; Professor at the Conservatory of Arts and Sciences, Member of the Central Jury.  
 JOHN PERCY, M.D., F.R.S., Museum of Practical Geology, London; Professor of Metallurgy.  
 J. PERROZ, France; Professor of Chemistry, Member of Central Jury, &c., &c. (Juror in Class XVIII.)

THE whole number of Exhibitors whose contributions were brought under the consideration of the Jury of Class II. appears to have been 270, of whom 152 were Foreign Exhibitors, and 138 English, or of the United Kingdom. Of these there appeared as Exhibitors, chiefly or exclusively, of the following classes of substances:—

Of collections of the larger chemical products, such as the mineral acids, carbonate and bicarbonate of soda, chromates and prussiates of potash, borax, chloride of lime, salts of ammonia, and metallic salts for the use of dyers and calico-printers, 31 Exhibitors; 22 Foreign, and 9 English.

Of alum and other aluminous salts and sulphate of iron, 16 Exhibitors; 6 Foreign and 10 English.

Of yellow prussiate of potash and red prussiate of potash exclusively, 8 Exhibitors; 5 Foreign, and 3 English.

Of salts of ammonia, 4 Exhibitors; 2 Foreign, and 2 English.

Of artificial ultramarine, 16 Exhibitors; 14 Foreign, and 2 English.

Of ceruse or white lead, and oxichloride of lead, 16 Exhibitors; 13 Foreign, and 3 English.

Of oxide of zinc or zinc white, and other zinc colours, 7 Exhibitors; 5 Foreign, and 2 English.

Of iodine and the salts of kelp, 5 Exhibitors; 1 Foreign, and 4 English.

Of acetic acid and acetic mordants, 3 Foreign Exhibitors. Of acetate of lead, 1 Foreign, and 2 English Exhibitors.

Of particular mineral paints and preparations to preserve wood, 6 Exhibitors; 4 Foreign, and 2 English. Of cinnabar 2, of litharge and minium 1, and of smalts 3 Exhibitors; all Foreign.

Of house-painters' colours and artists' colours, 11 Exhibitors; 4 Foreign, and 7 English.

Of liquids for staining and painting wood, and varnishes for wood, 5 English Exhibitors.

Of calico-printers' colours and lakes, 19 Exhibitors; 15 Foreign, and 4 English.

Of the products of the distillation of peat, 4 English Exhibitors; oils of bitumen and bituminous shale, 3 Foreign Exhibitors; oils of coal-gas tar, 2 Foreign, and 1 English Exhibitor; oils of resin, 1 English Exhibitor; purified animal oil, 1 English Exhibitor.

Of the rarer chemical products and substances recommended by their superior purity, chiefly intended for the use of scientific chemists, 4 Exhibitors; 2 Foreign, and 2 English.

Of collections of pharmaceutical products, generally numerous, including the alkaline, earthy, and metallic salts used in medicine, alkaloids and other organic preparations, 18 Exhibitors; 9 Foreign, and 9 English.

Of unmanufactured drugs, such as French opium, dried plants, &c., including one general collection contributed by the London druggists, 6 Exhibitors; 1 Foreign, and 5 English.

Of medicinal infusions, extracts, and confections, 9 Exhibitors; 2 Foreign, and 7 English.

Of cod-liver oil and skate-liver oil, 5 English Exhibitors.

Of quinine salts, 3 Foreign, and of magnesian preparations, 4 English Exhibitors.

The following pharmaceutical products were each shown by but one Exhibitor: by Foreign Exhibitors, salicin, quaidine, phloridzin, santonin, cream of tartar, and tartaric acid. By English Exhibitors, superphosphate of iron, benzoic acid, chloroform, sugar of milk, decolorized gum-arabic, aloine and cantharidine, kousso, sambul and matico, Indian bacil, myrrhine, a natural mineral water, artificial mineral waters (2 Exhibitors), and surgical lint.

The following miscellaneous chemical products and preparations were also the contributions of their respective Exhibitors solely: of Foreign Exhibitors, boracic acid, phosphorus, porcelain colours, dyed wool flecks, guaranine, chemical preparation for restoring gold and silver embroideries. Of English Exhibitors, red phosphorus, bicarbonate of soda, chloride of sodium, large single crystals of salts, crystallized sulphur, stannate of soda, refined nitre, cyanide of iron, hippuric acid, valerician acid with a series of the valerianites, a disinfecting powder, preserved size, starch, gum, and other products of the potato; a material imported for dyeing black; a new brown colour; woods furnishing dyes, oils, and medicinal substances; illustration of ale and porter brewing; tinted paper for bank cheques; parchments restored after injury by fire; wood preserved by a peculiar chemical process; a marking ink; a cement, Poole's Chinese cement; restored cotton waste; wash-

ing blue; a varnish for labels and artists' designs, blacking and French waterproof varnishes.

The specimens of the larger chemical products exhibited from the British manufactories, were frequently on a magnificent scale, and of singular beauty; such as the crystallized citric and tartaric acids, the chromates and prussiates of potash, sal ammoniac, alum, carbonate and bicarbonate of soda, and the sulphates of copper and iron. The pharmaceutical collections were also remarkably fine and extensive, including very beautiful preparations of iodine, of mercury, lead, zinc, antimony, silver, potash, and soda; double salts of iron; the salts of morphia, strychnia, and even the rare creatine and creatinine; while medicinal plants were so well preserved as to appear with all the beauty of the living plant. Several of the processes, also, were illustrated by instructive series of specimens, exhibiting the successive steps of the manufacture, as the alum process by shales in different stages of decomposition; the different steps in the white lead manufacture; and others. Many fine specimens were also contained in the foreign collections, although generally smaller and less prominent. It was evident that chemical manufacturing had attained more subdivision in England than abroad, with larger individual production. On the other hand, the great variety of products from a single manufactory was often very striking in the foreign, particularly the German, collections; a variety without inferiority of quality, which bore testimony to the excellent chemical education and varied resources of the exhibitors.

A great reduction in the cost of production is quite as remarkable in chemical substances as in the products of mechanical ingenuity, and equally indicates improvement in the chemical as in the mechanical arts. The great staple articles, such as the mineral acids and the alkaline salts, have become available, from their cheapness, to a variety of new applications, which are gradually altering the aspect of chemical manufactures. Thus we now find sulphuric acid applied directly to clay to form a sulphate of alumina, which competes with alum; and the sulphate of copper, the sulphate of magnesia, and even the sulphate of iron, produced by the direct combination of their constituents. The ore of lead we see treated with the hydrochloric acid of the soda process to form a rival pigment to white lead; and the ores of copper and tin fused with alkaline salts, as the means of purification and reduction, or to form a new salt.

Of a large proportion of the chemical products exhibited, the features which claimed most of the consideration of the Jury were the superior quality and beauty of crystallization of the salts, indicating a high degree of purity in their composition, and superior excellence of manufacture. Such may be said to be the general ground of the award of the honorary distinctions which have to be reported. But in a considerable number of instances the product was further recommended by its novelty, or by some important improvement in its preparation, which demands more special notice.

#### RED OR ALLOTROPIC PHOSPHORUS.

Of the elementary and non-metallic substances, an instance of singular interest was presented in the allotropic phosphorus of Schröter, manufactured and exhibited by Messrs. J. and E. STRAZL of Birmingham (119, p. 199). The extraordinary conversion of phosphorus into a red infusible powder is effected by exposing melted phosphorus in a close vessel, to a degree of heat which is near the boiling point of that substance, and which is kept up for a considerable time. It is probable, from the entirely inodorous character of the specimens recently manufactured, that the amorphous phosphorus is now made without the use of sulphuret of carbon to remove any excess of unaltered phosphorus. This new preparation presents great facilities in the manufacture of matches, from being no longer spontaneously inflammable, and yielding no smoke of phosphorous acid, which was found highly injurious to health, producing caries of the bones, particularly of the lower jaw, in workmen exposed to it. The combination of red lead with the amorphous phosphorus in the matches causes them to ignite as usual by friction.

#### IODINE.

Perhaps the earliest, as they are still among the most esteemed, manufacturers of iodine on the Continent, after its first discoverer, M. Courtois, are the Messrs. COURNEUX and Co., of Cherbourg (462, p. 1200), who have created in their own sphere a branch of industry in the preparation of iodine, of chloride of potassium, and the other salts of kelp; of which specimens were exhibited, remarkable for purity and beauty. With the exception of the iodine used in photography, the whole iodine produced appears to be still consumed in medicine, and chiefly in the form of iodide of potassium, and other iodides, only a comparatively small quantity being retained as iodine. Of iodine from kelp there are also two Scotch and two Irish Exhibitors, who are each considerable manufacturers. The great increase in the production of iodine took place about 1840. The make of a single house in Scotland, from 1845 to 1850, averaged 276,000 ounces per annum, and is believed to form fully one-third of the entire produce of the United Kingdom during that period. The price of a pure dry article for the three years, 1848, 1849, 1850, remained between 7½d. and 8½d. The price for 1851 is from 6d. to 6½d., with an excess of production.

#### SULPHURET OF CARBON.

Among the newest of chemical manufactures is that of sulphuret of carbon, represented by Dr. L. C. MARQUART, of Prussia (1. - 327, p. 1069). This liquid has found a singular application in electro-plating, the addition of a few drops of it to the silver solution causing the metal to deposit bright, a fact which appears to have been independently discovered by the Messrs. Elkington, and by Mr. Lyons, of Birmingham, who both exhibit illustrations of this application of the substance.

#### BORACIC ACID.

The preparation of boracic acid by Count F. de LARDEREL, of Tuscany (35, p. 1294), was rewarded by a Council Medal. Although this well-known manufacture is not recent, having attained its full development at least ten years ago, still the bold originality of its first conception, the perseverance and extraordinary resources displayed in its successful establishment, and the value of the product which it supplies, will always place the operations of Count de Larderel among the highest achievements of the useful arts, and demanded the most honourable recognition at this epoch. The vapour issuing from a volcanic soil is condensed, and the minute proportion of boracic acid which it contains (not exceeding 0.3 per cent.) is recovered by evaporation, in a district without fuel, by the application of volcanic vapour itself as a source of heat. The boracic acid thus obtained greatly exceeds in quantity the old and limited supply of borax from the upper districts of British India, and has greatly extended the use of that salt in the glazes of porcelain, and recently in the making of the most brilliant crystal, when combined with the oxide of zinc instead of oxide of lead.

#### SULPHURIC ACID.

The most novel feature in the manufacture of sulphuric acid, illustrated in the Exhibition, was the process of making this acid in vessels of earthenware instead of the leaden chamber, as designed by M. FOUCHÉ-LEPELLETIER (1229, p. 1236), and followed to a large extent at the celebrated works of Javel, near Paris. The material of these vessels is the salt-glaze ware, which resists acids; and they are in the form of large Wolfe's bottles, connected together in series. The acid fumes are carried through a large number of these vessels, by which the power of condensation is found to be one-third greater than could be obtained from a single chamber of equal capacity; while their original cost of construction is, to that of a leaden chamber, in the proportion of 12 to 100, and the cost of maintaining them is nothing. Such vessels have been in use at Javel since 1846; and of the large annual production of 3,600,000 kilogrammes of concentrated sulphuric acid in that establishment, one-third is at

present manufactured in this way. The acid thus prepared, is of course free from lead. The manufacture of vessels of the material described, for chemical purposes, being greatly on the increase in England, the process of Javel could be easily introduced, and appears well deserving of the consideration of manufacturers.

#### SALTS OF SEA-WATER.

A Council Medal was accorded to MM. PRAT and AGARD, of Marseilles (1882, p. 1267), for various salts, including the chloride of potassium, sulphate of soda, and sulphate of magnesia, prepared from sea-water, by the process of M. Bulard. The long-continued investigations of sea-water, by the last-named eminent chemist, have furnished valuable means for the separation of its useful salts. It appears that the sea-water of the Mediterranean may be concentrated by spontaneous evaporation to density 1·27, without depositing anything but common salt. The mother-liquor, or bittren, when further concentrated, first deposits, as its density rises from 1·27 to 1·32, a mixed salt, consisting of about 40 parts of sulphate of magnesia and 60 parts of chloride of sodium. Or, if the temperature falls to 6 or 7 Centigrade (43 or 45 Fahr.), bittren of density 1·32 deposits sulphate of magnesia nearly pure, in the proportion of about 90 kilogrammes of that salt from one cubic metre of fluid. The most economical application of this sulphate of magnesia is said to be in the conversion of chloride of sodium into sulphate of soda. The next important product obtained is, the double chloride of potassium and magnesium, which serves afterwards for preparing the chloride of potassium. This double salt is deposited from the bittren concentrated to density 1·345, by spontaneous evaporation, after the deposition of the magnesium salts; or by concentrating by artificial heat in an evaporating pan to the same extent. Dissolved in a small quantity of hot water, the double chloride undergoes decomposition, and allows the chloride of potassium to crystallize nearly pure on cooling. The last mother-liquor above density 1·345, after the separation of the potash, contains much chloride of magnesium; a salt which may be had recourse to as a source of hydrochloric acid, being decomposed by distillation.

M. Bulard has also proved that the greater portion of the sulphate in sea-water, separates, as sulphate of soda, from sea-water concentrated to from density 1·152 to 1·2, is cooled down to from —4 to —5 Centig. (25 to 23° Fahr.). Waters concentrated as far as density 1·2 to 1·264, produce an abundant deposit of sulphate of soda, even at —2° or —3° Centig. (28° to 26° Fahr.). Sulphate of soda, however, is procured more conveniently by dissolving together sulphate of magnesia and chloride of sodium, in the proportion of 55 of the former to 45 of the latter, at the temperature of 30 Centig. (86° Fahr.), and running off the solution of density 1·264 into open reservoirs. Such a solution exposed during a cold night in winter, deposits a considerable quantity of sulphate of soda at 5° or 6° Centig. (42° Fahr.); about 85 per cent. of the whole quantity of that salt which it contains, at + 2° Centig. (35·6° Fahr.); and if the temperature fall to —2° (28·4° Fahr.), the solution deposits nearly the whole of the sulphate of soda present.

The most important of these products is, no doubt, the chloride of potassium, and M. Bulard has, with good reason, looked to sea-water as the great natural source of potash. The water of the Mediterranean contains, according to the analysis of M. Usiglio, 0·0505 pound of chloride of potassium in 100 pounds of water, or about one two-thousandth part of its weight of that salt.

#### BICHROMATE OF POTASH.

The bichromate of potash was exhibited to great advantage by Messrs. DENTITH (8, p. 187), and other makers. Prior to 1820, the process universally followed for the preparation of this salt was, to calcine chrome iron with nitrate of potash. Bichromate of potash appears to have been consumed, at that time, in the preparation of chromate of lead only, and was sold at about 21s. per lb. The first alteration in the process was the addition of carbonate of potash to the chrome ore and nitre, by which a saving of

the latter salt was effected. The next great improvement made in the manufacture was the dispensing with nitre, and oxidising entirely by means of air admitted into the reverberatory furnace in which the ore mixed with carbonate of potash is calcined. This change took place about 1835 or 1836. An addition of lime to the preceding materials was made by Stromeyer, in Norway, a few years afterwards, and soon became general. The oxidation goes on quicker with the presence of lime, owing to the porosity of the mass, which allows the more ready access of air. The earliest great manufacturers of this salt in the United Kingdom were Kurtz and Niven, of Manchester, and Turnbull and Ramsay, of Glasgow, who were soon followed by the Whites in Glasgow, Swindells in Newcastle, and Dentith in Manchester.

The introduction of the yellow discharge (chromate of lead) upon Turkey-red cloth, by Daniel Koechlin, of Mulhouse, about 1820, appears to be the circumstance which first greatly increased the demand for this salt, and stimulated the improvement of its manufacture. Besides its familiar application, to produce the yellow and orange chromates of lead, bichromate of potash is now used in dyeing wool; a fast and solid black being produced by boiling the wool with bichromate and a little sulphuric acid, washing the wool in water, and afterwards dyeing with logwood in the usual way. By substituting other dye-stuffs for the logwood, various other colours are produced in a similar manner. The wool contains oxide of chromium, which acts like alumina or peroxide of iron in attaching colouring matters. Chromic acid has also been used in bleaching palm oil, and in oxidising oils for other purposes.

The following statement (kindly supplied to me by Mr. J. White, of Shawfield, Glasgow) of the entire production, during several quinquennial periods, of one of the oldest and most considerable manufactories of bichromate of potash in Scotland, gives a fair idea, I believe, of the general advance of this manufacture during the period alluded to:—

|   |    | Per Pound. |
|---|----|------------|
| In five years—                                | s. | d.         |
| 1825—1830, 315 tons, bichromate of potash, at | 2  | 0          |
| 1830—1835, 12·6 tons „ „ at                   | 1  | 0          |
| 1835—1840, 1870 tons „ „ at                   | 0  | 9          |
| 1840—1845, 2840 tons „ „ at                   | 0  | 8          |
| 1845—1850, 2970 tons „ „ at                   | 0  | 7          |

#### THE PRUSSIANES OF POTASH.

These important salts were exhibited of great purity and beauty, by several manufacturers, particularly Messrs. T. BRISWELL and Co., of Newcastle (27, p. 190); the HERULET AND CAMPBELL ALUM COMPANY, of Glasgow (13, pp. 188, 189); the BOWWILLER MINING COMPANY, of France (376, p. 1195); C. SCHLIER, of Russia (27, p. 1367), and ALEXANDER BRUSCHIN (24, p. 1367), also of Russia.

The manufactory of Messrs. Branwell was established about 80 years ago, at which time Prussian blue only was made in it: a considerable quantity of which, I am informed by Mr. Branwell, was sent annually to China, and used by the Chinese, it was believed, for colouring green teas: a spring shipment was always made of about 2,000, in value, which was often followed by another in autumn. It was first sold at two guineas per pound, made up in neatly-finished one-pound packages, but had fallen, in 1815, to 10s. 6d., and about 1820 to 2s. 6d. For the last ten years the price of Prussian blue has been 1s. 9d.

Prussiate of potash was not known in commerce in a crystallized state till about 1825, when the price was 5s. per pound. But for some years previously a weak solution of the salt, or of the fluxed mass of animal matter and potash, had been sold at 1s. per gallon. The process of manufacture, so far as regards the materials used and the furnaces employed, is still essentially the same as it was fifty years ago; but in consequence of agitation, the fluxed mass by machinery in closed pots, introduced at Glasgow by the late Charles Macintosh, in 1824, and other minor improvements in the manipulation, the production of prussiate from the same quantity of

animal matter has been increased threefold. The rapid progress of this manufacture will appear from the following estimated annual production in the United Kingdom:—

| Annual Production:—                        | Per Pound. |
|--|------------|
|  | s. d.      |
| From 1825—1830 about 10 tons, at . . . . . | 5 0        |
| 1830—1835 about 4½ tons, at . . . . .      | 2 6        |
| 1835—1840 about 200 tons, at . . . . .     | 1 4        |
| 1840—1845 about 700 tons, at . . . . .     | 1 4        |
| 1845—1850 about 1,040 tons, at . . . . .   | 1 3        |

The number of prussiate works in the United Kingdom is, at present, eleven, the whole making, when the salt is in demand, about 20 tons per week, of which the two largest works, those of Messrs. Bramwell, and the Harlet and Canspice Almu Company, are believed to produce four or five tons each. The value of the annual product for the last five years is calculated from the preceding data at 145,600*l*.

The most extraordinary event in the history of this manufacture is, the attempt under a few years ago to introduce the air-process, which is of much interest both in a scientific and practical point of view. As cyanogen is rapidly converted into ammonia, the artificial formation of the former from the nitrogen of air would likewise furnish an unlimited supply of ammonia, of which the importance to agriculture could not be over-estimated. The experiment was pursued with singular perseverance and ability, as will appear from the following valuable details, for which I am indebted to my friend Mr. F. H. Hughes of Horrowatownness:—

"In 1844 we commenced a series of experiments upon the large scale, at Newcastle, in company with Messrs. Bramwell, to manufacture prussiate of potash without animal matter, substituting the nitrogen of the atmosphere for it, and continued the experiments till the latter end of 1847.

"In these operations a tube or retort of fire-clay was placed in a vertical position in a furnace so constructed that, when the formation of cyanonic oxide was prevented, sufficient heat could be obtained to soften a Stourbridge fire-brick throughout its substance, when exposed in the flue, or off-go, to the full force of the fire.

"The lower part of the retort was made of cast-iron, kept out of the vicinity of the fire, and of sufficient length to afford time for the mass heated by the fire to become cool before it was discharged into a cistern placed below, containing water and a protosalt of iron, into which the lower end of the tube dipped. Provision was made at this end of the tube to regulate the periodical discharge of its contents, in whatever proportion was desired.

"The tube was filled with wood-charcoal, saturated with a solution of the carbonate of potash of commerce, and dried. The mixture in this state generally contained about 20 per cents of potassa (KO).

"By means of an air-pump, the atmospheric air was drawn through the tube of alkalinized charcoal, in a continuous stream from the top, and discharged below in the state of nitrogen and carbonic oxide.

"The alkalinized charcoal was thus found to become pretty rich in cyanide of potassium; one-half of the alkali of the cyanized charcoal frequently being found, upon testing, to be in combination with cyanogen; so that when all was working well, 36 or 40 cwt. of prussiate of potash were produced in a week by means of seven to eight retorts, of 10 to 12 feet long in the fire, and 2 feet internal diameter.

"In our first experiments such narrower tubes were employed, to which the heat was applied only externally; but as both the tubes and charcoal are bad conductors of heat, we could not operate upon sufficient quantities, and we found it necessary to build larger tubes with fire-bricks, of the above dimensions; leaving a circle of small apertures or chinks in the tube, every third or fourth tier of bricks, through which the intensely-heated gases, nitrogen and carbonic acid, were drawn from the flue surrounding the tubes, by the action of an aspirator. We thus had the whole interior of the large tubes

so hot, that an iron rod one inch in diameter became white hot when thrust down in the centre and allowed to remain there five or ten minutes.

"Our next improvement was to use the alkalinized charcoal undried, and to aspirate the air from below upwards, instead of downwards; the surplus heat drying the alkalinized charcoal before it reached that part of the retort in which the cyanide was produced, a length of 6 to 8 feet. The top of the retort was in this case rendered air-tight, and the cyanized mass discharged below as before.

"Through seven or eight retorts of the above size about 2,400 cubic feet of alkalinized charcoal were passed in a week; and about 1,200 to 1,400 cubic feet of cyanized charcoal were obtained, nearly one-half of the charcoal being consumed.

"There were two great drawbacks to this process; one, the immense quantity of material to be lixiviated for a small return of prussiate; the other, and by far the more important, an extraordinary waste of potash in the process, upwards of three parts by weight being consumed in producing one of prussiate. The whole of this waste could never be properly accounted for. About one part was, of course, recovered in a state of prussiate. It was found that another was lost in the small refuse charcoal, which could not be lixiviated to pay, and the remainder appeared to be partly combined with the bricks of the retort, and partly dissipated up the chimney.

"In 1847 we abandoned the experiment, after a loss of many thousand pounds. But we proved the possibility of producing large quantities of cyanide of potassium, by drawing intensely-heated nitrogen and carbonic acid gases through a mixture of potash and charcoal, with the difficulty of carrying this out as a manufacturing process from the great waste of potash.

"Our experiments were more directed to making the air process practicable, for the purpose of manufacture, than to ascertain upon what principle the formation of cyanogen depended; for it was immaterial, in a manufacturing point of view, whether the cyanogen were produced from the nitrogen of the atmosphere, or from the ammonia which the charcoal was always found to contain. The means of nicely observing the changes were lost from the necessity which existed in operating upon large masses, to draw the intensely-heated gases from the fire into the body of the tubes, in order to bring the alkalinized charcoal to a proper heat for the production of cyanide of potassium. It is probable that some part at least of the cyanogen was furnished from the ammonia in the charcoal, which in separate experiments in the laboratory, was found not to be entirely given off at a red heat. Some alkalinized charcoal, also brought to a proper heat in a porcelain tube, produced a considerable quantity of cyanide of potassium without the presence of air, the ends being stopped up. On the other hand, when the retorts were filled with charcoal not alkalinized, and the heated gases drawn through, no formation of either cyanogen or hydrocyanide of ammonia could be detected.

"A paper, by Professor Marchand, contained in the eighth volume of the Chemical Gazette, page 301, on the presence of nitrogen in cast iron and steel, appears to throw some light upon the subject. He has shown that when carbon is combined chemically with iron, and treated with potassium, in the presence of nitrogen, cyanogen is produced. It seems to me, therefore, probable that the first step in our process was the formation of a carburet of potassium, which by combining with the aspirated nitrogen produced the cyanide of potassium. This might be ascertained by examining the remainder left in the retort, after the production of potassium in the ordinary way from bitartrate of potash, testing the quantity of cyanide it contained, if any, and then testing the increased quantity after heating it in nitrogen gas.

"I have only further to mention that we substituted soda for potash, in the process, with the like loss."

Mr. Bramwell also considers that the process succeeded perfectly, in a chemical point of view, although it did not answer as a commercial speculation; and ascribes its failure in economy chiefly to the circumstance that the fire-clay tube could not be made to resist, long, the

combined action of the alkali and of the excessive heat applied.

In 1842-43 the use of the red prussiate of potash in calico-printing was introduced, and since that time a considerable and increasing quantity of the yellow prussiate has been converted by means of chlorine into that salt.

Shortly afterwards both salts were successfully employed in "de laine" printing, as well as in dyeing wool; the blue from the red prussiate being found more durable when fixed by peroxide of tin. The red salt is also mixed with wood colours, to oxidise them, or produce the greater depth and beauty of colour which long exposure to air, without light, otherwise induces in the dye-woods.

#### CARBONATE OF SODA.

Few chemical processes have maintained their ground for so long a period as the grand process for the preparation of carbonate of soda from chloride of sodium, by means of sulphuric acid employed to convert that salt into a sulphate, followed by the decomposition of the latter salt by coal and carbonate of lime, upon the floor of the reverberatory furnace. The instructions given by Leblanc, who invented this soda-process at the end of the last century, might still be taken as directions at the present day.

All the carbonate of soda produced in the United Kingdom by this process, up to 1825, was sent into commerce in the form of the crystallized carbonate only. The manufacture was advanced into importance chiefly by the skill and exertions of the late Charles Tennant, at the great chemical works of St. Rollox, near Glasgow. The salt is, in consequence, known in London, to the present day, as "Scotch soda." The crystals were sold in 1820 at 35s. per cwt., but the price descended gradually in three or four years to 20s. partly in consequence of the increasing demand, at this time, for bleaching powder, giving rise to the formation of much sulphate of soda; and partly from the great reduction in the price of common salt, arising from the increased production which followed the abolition of the Excise duty upon it, although a drawback of the duty had always been allowed upon the salt consumed in this manufacture. The price of crystallized carbonate of soda, at the present time is about 6s. per cwt. About 1823, the soda-ash trade was originated in Liverpool, by the enterprise of James Muspratt, and soon extended to Newcastle, which is now the principal seat of the manufacture, and to other places. When, formerly, the production of carbonate of soda was combined with that of chlorine, the dioxide of manganese was mixed with the common salt and sulphuric acid, which involved an after-operation for the separation of the manganese; but now, the hydrochloric acid is first separated by the action of sulphuric acid upon chloride of sodium alone, in a peculiar form of the reverberatory furnace, and condensed in a stone tower, filled with moistened pebbles, through which the vapours are conveyed; while the chlorine is evolved by the direct action of hydrochloric acid upon manganese, in excavated vessels of sandstone, which are heated by steam applied externally. Depending also, as this soda process does, upon the economy of the sulphuric acid manufacture, it was greatly benefited by the improvement introduced into this country, about 1828, (by Kestner, of Thann,) of throwing steam into the leaden chamber, by which the full equivalent of sulphuric acid came to be obtained for the sulphur consumed. The consumption of nitre, or of nitrate of soda, was also reduced, by the proper management of the chamber, from one-sixth to one-twentieth of the weight of the sulphur, independently of the application more lately made by Gay-Lussac, of strong sulphuric acid to absorb and recover the nitrous fumes which are usually allowed to escape with the exhausted air of the chambers.

The attempts of chemists to modify or entirely supersede the soda-process of Leblanc have been incessant, and of the most diversified character. One of the latest of these is the process of Mr. LONGMAID, (Cl. I., 441, p. 162), for decomposing common salt by means of iron pyrites, which appeared to the Jury to have that amount

of success which, considering the difficulties to be surmounted and the fundamental character of the soda manufacture, entitled it to the high distinction of the Council Medal. It was ascertained that, with a pyrites containing two or three per cent. of copper, sulphate of soda was economically produced by the ignition of the former with chloride of sodium,—the recovery of the copper converted at the same time into sulphate of copper, contributing to the profit. A process, also, like Mr. Longmaid's, which entirely dispenses with the preparation of sulphuric acid in the leaden chamber, is further recommended by the circumstance that it may be found applicable from its simplicity in certain localities where the ordinary process would not be practicable.

#### STANNATE OF SODA.

Of the salts of tin exhibited, the most novel preparation is the stannate of soda, in a dry state, which is contributed by G. E. BRAUN, of Austria (21, p. 1008), and also by J. YOUNG, of Manchester,—by the latter in a beautifully crystallized form. The neutral dry salt was introduced a few years ago by Mr. Meerer, for the use of calico-printers, and prepared by an original process. Metallic tin was oxidized by a mixture of nitrate and hydrate of soda, which give rise to the stannate of soda, with evolution of ammonia:—

The process of Mr. Young (7B., p. 187), which is more recent, is also new, and presents a strikingly beautiful application of science. Instead of reducing metallic tin from the ore, and oxidating the metal again to form the stannic acid, at the expense of nitric acid, Mr. Young takes the native peroxide of tin (stannic acid) itself, and fuses it with soda. The iron, and other foreign metals present in the ore, are dissoluble in the alkali; so that by solution of the fused mass in water, a pure stannate of soda is obtained at once. It is crystallized by evaporation, and obtained in efflorescent octahedral crystals, containing nine equivalents of water.

#### ARTIFICIAL ULTRAMARINE.

In the person of M. J. B. GUINET, the Jury were able to offer their highest mark of distinction to the first discoverer of the artificial ultramarine. The process of Guinet was communicated confidentially to Gay-Lussac, on the occasion of its being rewarded for the first time by the Société d'Encouragement in 1828. M. Guinet (1620, p. 1255) still maintains an incontestable pre-eminence also as a manufacturer among the now numerous producers of this substance,—his product being remarkable for the intensity of its hue, and standing well the dilution with a white powder, which is a most trying test of that property. It appeared to the Jury, assisted in the department of colours by Mr. Linton, who, as an artist, has made the chemical properties of colours a peculiar study, that, for use in oil and water-colour painting, a pure blue ultramarine, unmingled with red, is desired; while, on the other hand, the ultramarine is recommended, by its purple bloom, as a colour upon cloth. The specimens exhibited generally possessed the latter character, and were no doubt chiefly intended for calico-printing. The discovery of a method of attaching this insoluble pigment to cloth by means of albumen, which is ultimately coagulated by heat, combined with the low cost of production, has led to a great demand for ultramarine, and rapid extension of the manufacture within the last few years. Certainly, many of the finest effects in the beautiful prints at present exhibited are produced by its means.

As the process of M. Guinet was never published, ultramarine has had other independent discoverers: of whom Professor Gmelin, of Tübingen, Professor Persoz, of Strasburg, and M. Koettig, director of the Saxon Ultramarine Works, are best known.

Prior to 1847, only two manufactories of ultramarine existed in France, those of Guinet and Courtial, and in Germany that of Levekus was in operation; but at that date, the works of Zuber and Co., of Rixheim in France, were established, and subsequently a large number of manufactories have arisen, twenty, at least, in Germany.

where the price of the article has attained its lowest limit. The production of ultramarine by Messrs. Dauptain, Gorton, and Co., in London, and by Mr. Schmersahl, in Manchester, is also comparatively recent.

The total production of ultramarine in France, in 1848, in three manufactories, is estimated at from 90,000 to 100,000 kilogrammes; and for 1851, in four manufactories, from 150,000 to 170,000 kilogrammes; the price of the finer sorts having fallen during the same period from 9 to 5.50 francs per kilogramme. One of the latest improvements in the manufacture of the preparation, by Messrs. Zuber and others, of a green ultramarine, of excellent quality, for printing upon cotton and paper, and which has the advantage over arsenical greens of being neither poisonous nor alterable by alkalis.

#### ALUM AND COPPERAS.

The manufacture of alum and copperas from the pyritous schists of the coal formation is as ancient in England as the reign of Elizabeth, and still maintains its ground in competition with several new and successful processes for both of these salts. It was represented by Messrs. Moberly and Co. (Cl. I., 17, p. 189), of the Whitby alum district, and by the HULLER and CAMPBELL ALUM COMPANY (13, pp. 188, 189), with Messrs. JOHN WILSON and SON (6, p. 185), from the neighbourhood of Glasgow. It is understood that the processes of these eminent manufacturers have not been stationary, but have received improvements of late years, by which the produce from the schist is considerably increased. The residuary mother-liquor is made a source of sulphate of magnesia, which was exhibited by Messrs. Moberly. This liquor is purified from salts of iron and other metals by means of caustic magnesia, obtained by calcining magnesian limestone and washing the lime out of it, according to the patent process of Dr. T. Richardson, of Newcastle.

Excellent alum was exhibited by Mr. SPECK, of Pendleton (7, p. 185), prepared by the direct application of sulphuric acid to the aluminous shale of the coal formation, with the addition afterwards of sulphate of ammonia; and also sulphate of iron, prepared by combining sulphuric acid directly with the residuary oxide of iron of burnt pyrites. Sulphate of alumina itself also has become a considerable manufacture, under the name of "concentrated alum," and was exhibited by Messrs. PATTERSON, of Newcastle (18, p. 189), who originated the manufacture.

#### WHITE LEAD.

Several producers of white lead, manufactured by the old processes, are distinguished among the awards of this Jury, particularly T. LEFEBRE and Co., of France (580, p. 1205), Baron F. P. VON HERNERT, of Austria (32, p. 1008), and Bischof and Rhodus, of Prussia (Cl. I., 312, p. 1068). The product of STRATINGH and Co., Netherlands (3, p. 1142), is also honourably mentioned. Other salts of lead which have been proposed to replace the carbonate, such as the sulphate of lead with excess of oxide, although equal in whiteness and opacity, have generally been found comparatively deficient in some other property when brought into use. Such substitutes have proved over-sensitive to sulphuretted hydrogen, and tarnish more rapidly than white lead in similar circumstances; or, their excess of oxide appears to combine with the oleic acid and produce a paint which is streaky under the brush, or does not "flat" well, and the remarkably small proportion of oil necessary to liquify the carbonate of lead (a gallon of oil to the hundredweight of white lead) is apt to be exceeded. A new substitute, however, exhibited by Mr. H. LEE PATTERSON, a member of the Chemical Jury, appeared highly deserving of commendation, from the originality of the process, namely, the *trichloride of lead*, consisting of single equivalents of chloride and oxide of lead. This salt is prepared by decomposing native galena by the hydrochloric acid, which is produced in great excess in the manufacture of soda; dissolving the chloride of lead thus formed in boiling water, and mixing the solution with the proper quantity

of lime-water to convert one-half of the chloride into oxide.

The following statements represent the present condition of the white lead manufacture in France:—The manufactories are principally concentrated in the neighbourhood of Lille, where seven exist, having an average total annual production of 4,550,000 kilogrammes. In the rest of France there are only three other considerable works, two at Paris and one at Tours, making together about 1,600,000 kilogrammes. The works at Marseilles and Strasburg are small, their united production being about 300,000 kilogrammes. Hence the whole annual French production of white lead is 6,450,000 kilogrammes. White lead was worth 100 francs the hundred kilogrammes in 1825, the price of lead being then 65 francs. At present white lead in France is only worth 65 francs, with lead at 50 francs. There is a duty in that country upon the metal of 5.50 francs.

#### ZINC-WHITE.

The introduction of oxide of zinc, as a white paint, in the place of a salt of lead, is one of the most remarkable events in the recent history of the chemical arts. This application, first successfully made in France, is rapidly extending on the Continent, and also in England. An oxide of zinc of great whiteness and opacity is obtained by the combustion of the metal in air. This oxide, mixed with 15 or 16 per cent. of its weight of linseed oil, previously heated with a small quantity of peroxide of magnesia, gives a paste which covers well, and has the advantage of not being blackened by sulphureous exhalations. The oxide of zinc of some of the exhibitors has been prepared by burning the metal, as it is first evolved from its ore in the reduction process, an arrangement which must diminish considerably the cost of production.

#### GARANCEINE.

A considerable portion of the madder roots, instead of being ground and exported in that form, as heretofore, is now exposed, after being moistened with dilute sulphuric acid, to a boiling heat by means of steam, by which the colouring matter is considerably altered and improved in quality for some dyeing processes, while the quantity rendered soluble in water is greatly increased. The madder so prepared is known as garanceine, and forms an important branch of manufacture in the south of France, which was well illustrated by a collection of specimens supplied by the Chamber of Commerce of Avignon (1049, p. 1229). The spent madder, after being used in dyeing, is now also converted by Mr. H. Steiner, of Accrington, into a garanceine (termed *garanceine* by the French) by steaming it with sulphuric acid in the same manner as the fresh madder, and thus a considerable quantity of colouring matter is recovered and made available which was formerly thrown away in the spent madder. Both varieties of garanceine give a more scarlet red than the unprepared madder, and also good chocolate and black, without soiling the white ground, but are not so well fitted, particularly the garanceine of spent madders, for dyeing purples, lilacs, and pinks.

#### LIQUID PRODUCTS FROM THE DISTILLATION OF COAL AND PEAT.

The condensable products from the distillation of coal and other bituminous substances are becoming every day more important from their various applications. The solid portions of the gas-tar are mixed with gravel, sand, and lime, and made use of for laying the floors of cellars, rootpaths, &c. In causewaying the streets of Manchester, the small granite blocks are placed upon a good bed of concrete, about three-quarters of an inch apart, and a space filled up by pitch to within half an inch of the top. The crude oil, distilled from the pitch, is employed to a great extent for impregnating wooden piles to be driven under water, which are thus protected from decay, and from the ravages of marine insects. A great portion of the tar is distilled to obtain naphtha, which is used with oil of turpentine as a solvent of caoutchouc. The volatile naphtha from cannel coal is the most suitable for this purpose, and also for naphthalizing coal gas. Coal

naphtha is also used for external lighting, the working sheds and yards of some manufactories being thus brilliantly illuminated. The naphtha is then burnt in the lamp invented by Mr. Beale, in which the ignition is promoted by a jet of air transmitted from the fan-blower or other blowing-machine.

The volatile alkali of the ammoniacal liquor is now generally saturated with sulphuric acid and crystallized, the process being here effected by distilling over the volatile salts of ammonia, and condensing in sulphuric acid. All the carbonate comes over in the first fourth of the liquid distilled; lime is then introduced into the still, to disengage the small remaining portion of ammonia combined with fixed acids, and the distillation completed. The sulphate of ammonia, which is thus produced for from 12l. to 14l. per ton, is used in alum-making and in agriculture, or converted into sal-ammoniac and the carbonate of ammonia. The manufacture of ammoniacal salts was well illustrated by Mr. F. C. HILLS, of Deptford (23, p. 190), and other exhibitors, both of the United Kingdom and Foreign States.

The Chemical Jury likewise extended its commendation to all the exhibitors of the products of the distillation of peat, although properly belonging to Class I. Prize Medals were also awarded to A. WISEMAN and Co., of Prussia (334, p. 1010), for the products of distilled schist; to A. MOREAU, of France (1361, p. 1241), for a series of products of distilled bitumen; and to J. YOUNG, of Manchester (7B, p. 187), for paraffin and oils obtained from coal.

The process last referred to is one of great importance, which has only been fully developed since the Jury made its awards. By distilling the cannel coal of Boghead, near Bathgate, in Scotland, at the lowest red heat, Mr. Young is said to obtain a quantity of oil, amounting to about 20 per cent. of the weight of the coal. This oil, after rectifying off a small portion of its more volatile part, is exceedingly well adapted for lubricating machinery. It does not oxidize in air, and is equal to the best specimen oil for the purpose stated, being a rich solution of paraffin in more volatile oils. It is difficult to estimate the advantage, in a variety of points of view, of so valuable a discovery.

Such were the principal novelties in the chemical department of the Exhibition. But there is reason to believe that many substances besides those already described were the results of improved processes, peculiar to their respective manufacturers, although no claim was made upon that ground. The full merit of many of the Exhibitors, particularly in the pharmaceutical division, can thus be only very imperfectly estimated. The remaining references to points of interest will be given under the names of the Exhibitors.

The following enumeration of the principal Exhibitors in Class II. contains, with a notice of their contributions, a statement of all the awards both of the Prize Medal and of the distinction of Honourable Mention which were made by the Jury.

ALDANI BROTHERS, of Turin (7, p. 1302), obtained Honourable Mention for a collection of chemical products of good quality, including the mineral acids, nitrate of baryta, gelatine, and soda-soap.

ANTHELMÉ, of Auden (Aisne) (1541, p. 1250), obtained Honourable Mention for alum manufactured by him.

P. H. AUBERGIER, of Clermont Ferrand (754, p. 1216), exhibited French opium, prepared by a method of incision invented by himself; and also the syrup of lettuce.

H. F. L. AUGUSTIN, of Halberstadt (826, p. 1095), obtained Honourable Mention for the good quality of his acetate of lead.

JAMES B. AUSTIN, of Banbury (114, p. 199), exhibited decoctions and infusions of medicinal substances, prepared by him.

THE CHAMBER OF COMMERCE OF AVIGNON (1043, p. 1229) had the Prize Medal accorded to it for galleine; a valuable form in which madder is prepared, and which is manufactured largely in the south of France, where madder is cultivated.

F. BANKART and SONS, of Swansea (49, p. 193), exhibited copperas, manufactured by them in that locality.

JAMES BENJAMIN BARNES (45, p. 192) had the Prize Medal accorded to him for valerianic acid, produced by the oxidation of fusel oil by means of chromic acid; exhibited, together with a series of the valerianates of the alkaline, earthy, metallic, and organic bases, of singular extent and completeness.

JAMES BASS, of Hatton Garden (95, p. 197), exhibited specimens of the concentrated medicinal infusions and decoctions which he prepares, and which are much esteemed in the trade.

WENZEL BATKA, of Prague (9, p. 1007), exhibited, in addition to his chemical glass apparatus, specimens of tungstic acid, oxide of uranium, and of the rarer metallic oxides, together with selenium in great quantity; for which collection of chemicals the Prize Medal was awarded.

GEORGE BELL and Co. (66, p. 194) exhibited mineral paints, compounded so as to dry quickly under water, and to remain attached to metals exposed to extreme heat.

ISAAC LEWTHIAS BELL, of Washington Chemical Works, Newcastle-upon-Tyne (12, p. 488), exhibited specimens of Pattinson's patent oxichloride of lead, with illustrations of its use in oil-painting.

JOHN BELL and Co. (116, p. 199), of which firm Mr. J. Bell, Juror of Class II., is a partner, exhibited several pharmaceutical products carefully prepared by them, including cod-liver oil, the stearine from that oil, simple and compound extracts of sarsaparilla, oil of lavender, benzoate of ammonia, iodide of iron, extract and tincture of Indian hemp, juice of taraxacum, &c.

PIETRO BIGAGLIA, of Venice (34, p. 1068), obtained Honourable Mention for his white lead, litharge, and verdigris.

BISCHOF and RHODTS, of Bonn (312, p. 1068), had the Prize Medal awarded to them for their white lead, which was remarkable for its density and great opacity.

Professor S. BLANKHOPE, of Delft, and K. FATHOVEN, of the Hague (1, p. 142), had the Prize Medal awarded to them for their excellent white paints manufactured from oxide of zinc. They exhibited also a yellow chromate of zinc, chloride of zinc, and a pigment which was named green oxide of zinc.

L. BIGNETRE, of Bonn (313, p. 1068), obtained Honourable Mention for good potash-alum. The Rhenish alum is obtained by burning together a highly pyritous lignite and clay, which yield the potash as well as the other constituents of the salt.

BREIDELL, SPENCE, and Co. (48, p. 192) had the Prize Medal awarded to them for their painters' colours, of which they exhibited a most extensive and beautiful collection.

A. BO, of Turin (19, p. 1303), exhibited a very select collection of lakes and mineral colours.

BOMÉ (Widow) and LEMIRE, of Choisy-le-Roi, Seine (1092, p. 1230), had the Prize Medal awarded to them for the acid obtained from the distillation of wood, and its salts, which they exhibited. Their glacial acetic acid remains solid at 60 Fahr. This collection included the oils from both wood and coal-tar, in a colourless state; finely crystallized tartrate of antimony, and several other metallic salts.

J. BONJAN, of Chambéry, Sardinia (12, p. 1303), had the Prize Medal accorded to him for ergotine. This extract of the *Sacale cornutum* appears to be judiciously prepared according to the prescription of the exhibitor.

BOZ and SOX, of Höttingen, Wurtemberg (2, p. 1114), exhibited good iodide of potassium, and creosote from tar.

BOSS, of Warsaw, Poland, exhibited alum which merits commendation.

THE CHEMICAL MANUFACTORY OF THE BOUXVILLER MINING COMPANY (376, p. 1195), under the direction of M. Schattenmann, had the Prize Medal awarded to it for fine specimens of alum, prussiate of potash, and glue. Sulphate of iron was also exhibited.

J. BOWEN, of Blunet, Leeds (42, p. 191), exhibited carbonate of soda, pure and neutral in composition, and thereby particularly adapted for scouring wool or cotton

goods, as it removes grease without injuring the animal fibre.

T. BRAMWELL and Co., of Heworth Chemical Works, Newcastle-upon-Tyne (27, p. 190), had the Prize Medal accorded to them for prussiate of potash; of which salt they are amongst the oldest producers in England.

E. BRASSEUR, of Belgium (42, p. 1153), received Honourable Mention for his white lead.

BRASSEUR and Co., of Nippes near Cologne (314, p. 1068), contributed specimens of white lead remarkably white and dense.

G. J. BRAUN, of Prague (21, p. 1080), obtained Honourable Mention for his prussiate of potash and stannate of soda.

WILLIAM ARTHUR BREAREY, of Douglas, Isle of Man (80, p. 196), exhibited a refined oil, which is recommended for watches and fine machinery, from having no chemical action on metals, and not being thickened by cold.

— BREMIGER, of Kirchheim, contributed a great display of ultramarine from Germany.

A. BUIÈRE, of Paris (438, p. 1199), obtained Honourable Mention for his arsenical preparations, including arsenic acid, and very fine Brunswick green.

F. X. BUOSCHE, of Prague (20, p. 1108), exhibited a fine collection of chemicals, including succinic acid and the oxides of chromium and uranium, for which the Prize Medal was awarded.

BUONELLI, of Frankfurt, exhibited a colourless oil from gas-tar, chiefly benzole.

— BROWN and Co., of London (7c, p. 187), had the Prize Medal awarded to them for their salts of ammonia, obtained in the purification of coal-gas by Mr. Croll's processes.

FREDERICK BROWN (57, p. 198) had the Prize Medal accorded to him for oxide of zinc colours, which he has contributed much to introduce into use in this country. The oxide of zinc is substituted for carbonate of lead, to give body to various paints (browns, yellows, reds, blues, and greens).

ALEXANDER BRUSCHIN, of Koselsk, Russia (29, p. 1957), received Honourable Mention for the excellent prussiate of potash which he exhibited.

W. BÜCHNER, of Plümsstadt near Darmstadt (1, p. 1125), had the Prize Medal awarded to him for ultramarine, of which he exhibited the greatest variety.

THE TRUSTEES OF THE LATE J. BUCKLEY, of Manchester (4, p. 185), exhibited sulphate of iron, which obtained Honourable Mention for its purity and superior quality.

EDWARD BULLOCK and Co., of Galway (37, p. 191), exhibited various preparations from sea-weed, including salts of potash and soda, rough and finely-crystallized iodine, iodides of potassium, lead, and mercury.

JOHN LLOYD BULLOCK (34, p. 191) had the Prize Medal accorded to him for a beautiful collection of the rarer chemical substances, displayed in considerable quantities and of good quality; especially creatine, to the extent of several ounces, creatinine, caffeine, allantoin, uric acid, hippuric acid, and urea.

STEPHEN JOHN BURT (85, p. 196) had the Prize Medal accorded to him for his beautifully-crystallized cantharidin, the blistering principle of cantharides, as obtained by solution or sublimation, and in combination with the bases potash, soda, and oxide of lead.

CHARLES BUTTON (3, p. 185) exhibited a remarkably varied collection of salts and acids, chiefly for the use of scientific chemists. The collection included potash, soda, ammonia, and chrome-alum, fine, crystallized; pure iodine, bromine, &c., which received Honourable Mention.

F. CALLOUD, of Annecy, Savoy (11, pp. 1802-03), obtained Honourable Mention for excellent phloridzin. He exhibited also santonin and morphine.

CAPPELLEMAN, DEBY, and Co., of Brussels (37, p. 1152), had the Prize Medal awarded to them for a large collection of salts, including pink salt, generally of superior quality.

LOUIS FRANÇOIS C. CHATEL, of Paris (793, p. 1218), exhibited specimens of d. ed and milled wool, flocks, and paste-colours for paper-mongers, for which the Prize Medal was awarded.

JOHN CHESHIRE, jun., of Northwich, in Cheshire (80, p. 190), represented the salt manufacture, by a pyramid of best table salt, with several other specimens. The salt-mines and springs in Cheshire are worked to a greater extent than any others in Europe, their annual production being upwards of 800,000 tons.

G. CLIFFORD (26, p. 190) obtained Honourable Mention for his successful efforts in restoring deeds, writings, books, maps, engravings, &c., which have been injured by fire. The process was not communicated to the Jury, but specimens of engraved documents and leaves of books were exhibited, with one-half of them restored without separation from the injured portion. The unrestored portion was hard, horny, and brittle; the restored portion clean and flexible.

EDWARD CONBOLD (Cl. I. 228, p. 143) obtained Honourable Mention from various products derived from peat.

E. E. COCHUIS, of Oranienburg, Prussia (12, p. 1048), had the Prize Medal accorded to him for his prussiate of potash. This is one of the largest manufactories of that salt in the north of Europe. The annual production is about 150 tons.

COIGNET and SON, of Lyons (1153, p. 1233), obtained Honourable Mention for phosphorus of superior quality, with prussiate of potash and glue, which they exhibited.

M. A. C. COLLAS, of Paris (801, p. 1219), obtained Honourable Mention for the products of coal tar.

ROBERT NEI-ON COLLINS (169, p. 198) exhibited the disinfecting powder prepared by him. This powder consists of a mixture of chloride of lime and sulphate of alumina, and is highly efficacious in many circumstances, but must not be brought, either dissolved in water or dry, into contact with metals.

Mlle. ANNA COLVILLE, of Paris (802, p. 1219), exhibited a complete set of highly-valued colours for painting on porcelain, for which the Prize Medal was awarded.

W. CONRAD, of Paris (1156, p. 1233), had the Prize Medal awarded to him for the general excellence of his chemical products, which included purified iodine, iodide of potassium, and refined sulphur.

THOMAS AINSLEY COOK, of Newcastle-upon-Tyne (15, p. 189), received Honourable Mention for one of the finest specimens of crystallized carbonate of soda exhibited (manufactured by the Walker Alkali Company).

WILLIAM COPNEY (118, p. 199) obtained Honourable Mention for a collection of remarkable fine single crystals of chrome alum, sulphate of magnesia, sulphate of copper, and several other salts.

JOHN COPPOCK, of Bridport (65, p. 194), exhibited a chemical liquid for imparting the colour of mahogany and rose-wood to common woods.

G. CORRADI, of Tuscany (33, p. 1293), had the Prize Medal accorded to him for sulphate of quinine and well-crystallized santonin, in large quantity, exhibited by him.

COULSON, JUKES, and Co. (72, p. 195) exhibited mineral substances used in the manufacture of paints.

COURNERIE and Co., of Cherbourg, France (462, p. 1200), had the Prize Medal awarded to them for their chemical products derived from kelp, particularly iodine, which, it is said, they obtained finely crystallized by a single sublimation; iodide of potassium, chloride of potassium, sulphate of potash, &c.

COURTIAL, of Grenelle, near Paris (807, p. 1219), had the Prize Medal awarded to him for his assortment of ultramarines, which fully maintain, by their superior quality, the high reputation of the French manufacture.

J. CURTIUS, of Dnysburg, Prussia (458, p. 1276), was one of the exhibitors of ultramarine distinguished by a Prize Medal.

DAUNTAIN, GORTON, and Co. (63, p. 194), exhibitors of ultramarine, had the Prize Medal accorded to them for the beautiful samples of their manufacture.

JOHN THISTLEWOOD DAVENPORT (111, p. 198) had the Prize Medal accorded to him for a pharmaceutical collection, which was chiefly distinguished by the brilliant lamellæ in which several of the metallic salts were exhibited. The sulphate of quinine and hydrochlorate of morphia were in beautiful crystals.

JOHN DAVIES, of Manchester (70a, p. 195), exhibited preserved size, clear and strong, suitable for any climate.

DAVY, MAER MURDO, and Co. (62, p. 194), received the Prize Medal for the pharmaceutical products manufactured by them, including carbonate of ammonia, calomel, corrosive sublimate; benzoic, citric, gallic, and oxalic acids; acetate of zinc, nitrate of silver, chloride of barium, nitrate of baryta, tartar-emetic, of which the crystals were particularly fine; sulphate of soda, nitrate of ammonia, acetate of lead, sulphate of mercury, red oxide of mercury, glycerine, and pyrosanthin. The specimens were all remarkably good.

DUBAUDT BROTHERS, of Courtrai, Belgium (39, p. 1153), exhibited white lead of excellent quality.

DE CAVAILLON, of Paris (109, p. 1176), obtained a Prize Medal for salt of ammonia, prepared in the purification of coal-gas.

V. DELIGNOU, of France (1180, p. 1234), exhibited rectified products of the distillation of bituminous shale, a chemical manufacture which has attained more success in France than in England, probably owing to the shales of the former country being less contaminated with sulphur than those of the latter. An Honourable Mention was awarded to the exhibitor.

W. DENTITH and Co., of Manchester (8, p. 187), had the Prize Medal awarded to them for the products of their manufacture, by which the Exhibition was embellished; beautiful and colossal specimens of chromate and bichromate of potash, ferrocyanide of potassium, alum from the Whitchy shale, nitrate of lead, fine green oxide of chromium, and oxide of zinc.

DAVID DICK and Co., of Barch Chemical Works, Carlisle (7d, p. 187), exhibited copperas manufactured by Spence's patent process.

DIESEL and Co., of Saalfeld (824, p. 1095), contributed superior oil and water colours for painters.

DINNEFORD and Co. (51, p. 193) exhibited magnesium salts and their fluid magnesia (a solution of carbonate of magnesia in carbonic acid water).

DIXON, SON, and Co., of Newton Heath, Manchester (126, p. 199), exhibited specimens of matches made with Schröter's amorphous phosphorus, which are said to be as easily and cheaply made as the common matches.

GEORGE DICKSON and Co., of Edinburgh (79, p. 106), exhibited specimens of cod-liver, skate-liver, and ling-liver oil manufactured by them.

— DUGOP, of Osnabruck, exhibited mineral colours.

DOUIN and BROSSEY, of Labriche, near St. Denis (169, p. 1081), had the Prize Medal awarded to them for the peculiar excellence of their colours for the use of calico-printers.

WILLIAM L. DUNCAN, of Sydenham, Kent (76, p. 195), exhibited cotton waste before and after being used in cleansing machinery, to illustrate his process of restoring that substance.

DUNCAN, FLOCKHART, and Co., of Edinburgh (104, p. 198), exhibited a specimen of chloroform, manufactured by them, which appeared to possess a high degree of purity.

C. A. DUBOIS, of Hirschberg (Cl. I. 7 Zol., 1048), obtained Honourable Mention for a fine specimen of cinnabar, intended for sealing-wax.

L. DUFOUR, of Genoa (13, p. 1303), had the Prize Medal awarded to him for his salts of quinine, of which he exhibited the sulphate on a large scale, and the citrate.

THE ELECTRONAL BLUE COLOUR WORKS, of Hesse, Schwartzensfels (465, p. 1077), received Honourable Mention for beautiful samples of smalts, accompanied by other preparations of cobalt, and for ultramarine.

ELLAM, JONES, and Co., of Derby (58, p. 193), obtained Honourable Mention for a considerable collection of mineral and vegetable pigments manufactured by them.

SAMUEL FETTCOURT (64, p. 194) exhibited specimens of washing-blue.

F. J. EVANS (5, p. 185) exhibited finely-crystallized naphthalene from coal-tar.

GEORGE EVANS (Cl. I. 327, p. 143) obtained Honourable Mention for his numerous pest products.

BENJAMIN FAWCETT (39, p. 190) exhibited plain and ornamental specimens in graining or flatting, said to be produced by a kind of paint free from noxious effluvia.

The Firm of FOURCÉ-LEFEBVRE, of Javel, near Paris (1256, p. 1256), had the Prize Medal awarded to it for a

rich and elegant display of alkaline and earthy salts, accompanied by pure mineral acids; the sulphuric acid being manufactured in a peculiar manner. Ammoniacal salts are also prepared from uric acid for manuring purposes.

SOCIÉTÉ DE FLOREFFE, of Floreffe, near Namur, Belgium (38, p. 1152), obtained Honourable Mention for a good collection of the ordinary chemical products manufactured by them.

JOHN P. FOWLER (55, p. 193) obtained Honourable Mention for the pure benzoic acid manufactured by him.

FOX and HARRINGTON, of Manchester (44, p. 192), obtained Honourable Mention for a series of the larger chemicals, of which they are manufacturers; including common salt, sulphur, salt-cake (sulphate of soda), barilla or black-ash, soda-ash in illustration of the soda process; bleaching powder, nitrate of lead, fine crystals of chlorate of potash, bisulphate of soda, protochloride of tin, sulphate and nitrate of copper, the two prussiates of potash, with white, mottled, and yellow soda-soaps.

H. GADENANN, of Schweinfurt, Bavaria (12, p. 1099), is one of the German exhibitors of ultramarine to whom the Prize Medal was awarded.

GAUTIER-BOUCHARD, of Paris (1245, 1237), obtained Honourable Mention for various colours manufactured by him.

GODFREY and COOK (92, p. 197) had the Prize Medal accorded to them for their pharmaceutical products; among which their carmine and lake from cochineal, and carbonate of ammonia, were most remarkable.

SEPTIMUS H. GOSDON, of Tenbury (50, p. 193), exhibited the mineral waters of that locality, with the bromine and salts extracted from them.

T. GREENISH (124, p. 199) exhibited a soluble superphosphate of iron recently introduced into medical practice.

W. GRUNT, jun., of Berlin (43, p. 1050), exhibited prepared colours containing the mordant by which wool can be dyed in one operation without boiling. The process was illustrated by samples of well-dyed wool.

J. B. GUINET, of Lyons (1620, p. 1256), had the Council Medal awarded to him as the original discoverer of artificial ultramarine in 1828, and as being still one of the most successful manufacturers of that substance.

GUNEBERG, of Stettin, exhibited white lead of good colour.

GUTHRIE and Co., of Dusseldorf (459, p. 1077), exhibited pure ferrocyanide of potassium.

HÄHNEL and ELLIS, of Manchester (10, p. 187), had the Prize Medal accorded to them for a good collection of metallic salts, chiefly for the use of calico-printers; particularly the oxide, nitrate, and sulphate of copper, the oxides and most common salts of lead and tin, sulphate and hydrochlorate of ammonia from gas liquor, and the preparations of archil. The metals, named with their ores, and the commercial varieties of sulphur, were also well illustrated.

JOSEPH HALL, of Queenborough, in the Isle of Sheppey (40, p. 191), exhibited copperas crystallized in a granulated form, convenient for dry mixing. It is prepared from the river pyrites, of which about eight tons are consumed weekly.

W. HARTERLEY (170, p. 198) exhibited an elixir of sarsaparilla, said to be prepared without heat.

JAMES HAWTHORNE (39, p. 191) exhibited a new ink for staining oak and mahogany, with illustrative specimens.

P. HAYES and Co., of Salford (75, p. 195), obtained Honourable Mention for products manufactured from resin, including spirits for making varnish, cheap oils for machinery and tramways, &c.

HEITZEN, BROTHERS, of Tetschin, Austria (26, p. 1008), had the Prize Medal awarded to them for their cudbear and archil. A fine assortment of red and violet extracts was exhibited.

A. and W. HENINGWAY (24, p. 190) had the Prize Medal accorded to them for their double salts of iron, ferric tartrates and citrates, and other pharmaceutical preparations, which are extremely well prepared.

HENSEL, of Lichtenstein, near Osterode, exhibited white lead commendable for its colour.

BARON FRANCIS PAUL VON HERBERT, of Klagenfurt and Wolfsberg, Carinthia (30, p. 1008), the distinguished ma-

manufacturer, had the Prize Medal awarded to him for a collection of samples of white lead of excellent quality.

Baron I. VON HENNER, of Klagenfurt, Carinthia (38, p. 1006), received Honourable Mention for his varieties of orange and bright red lead, and red and gold litharge. These colours possessed a brilliancy which was not exceeded in any other collection.

O. HERRMANN, of the Chemical Manufactory (formerly Royal) at Schönebeck (Cl. I. 683, p. 1088), had the Prize Medal accorded to him for an extensive collection of chemical preparations, which appeared in general to be remarkably good. In the number may be mentioned glacial phosphoric acid of singular beauty, bromine, bisulphide of carbon, pure carbonates of potash and soda, free from silica and chlorine, for scientific chemists, pure gallic acid for use in photography, &c.

J. F. HEVL and Co., of Charlottenburg, near Berlin (44, p. 1050), exhibited colours for paper-hangings and painting; besides acetic acid, acetate of soda and acetate of lead manufactured from pyroligneous acid, at a very low price.

F. C. HILLS, of Deptford (23, p. 190), had the Prize Medal accorded to him for sal-ammoniac and carbonate of ammonia, of which he is a well-known manufacturer. The former salt is prepared by the addition of muriatic acid to the ammoniacal liquor of gas-works, and the latter salt by the decomposition of sulphate of ammonia by means of carbonate of lime. Nitrate of potash was also exhibited, prepared by the decomposition of the chloride of potassium of kelp by means of nitrate of soda.

HIRSCH and BROTHER, of Portugal (30, p. 1307-08), exhibited a fair collection of acids, salts, and other chemical products.

HIRSCHMANN, of Warsaw, Poland (26, p. 1367), represented the chemical industry of that city by a collection of salts.

J. HOCHBERGER, of St. Procopi Mineral Works, Kuhn, Bohemia (14, p. 1007), exhibited alum and sulphate of iron of good quality.

HOPKIN and WILLIAMS (41, p. 191) were accorded the Prize Medal for an interesting collection of the rarer chemicals used in medicine, particularly pure aconitine, a series of valerianates, "cardole," an oily substance obtained from the pericarp of the cashew nut, said to be a powerful vesicating agent; bromoform, iodoform, metagallic acid, pure tannin, and crystallized chromic acid.

HENRY HOPWOOD, of Richmond, Surrey (100, p. 192), exhibited beautifully-pure sugar of milk crystallized under different circumstances. The crystals formed at 160° Fahr., in the dark, were particularly fine.

HORSTMANN, of Horst, near Steele (Vol. I. 462, p. 1107), exhibited exceedingly beautiful samples of smalts.

HOWARDS and KENT, of Stratford (11, p. 187), had the Prize Medal accorded to them. Besides a highly-instructive and complete collection of the chichona barks, which excited great interest among scientific visitors, salts of the vegetable alkaloids were exhibited by this house, with camphor in every stage of preparation; Borneo camphor, borax, and boric acid, tartaric acid, citric acid, and their salts; various preparations of mercury of great purity, with salts of antimony, silver, zinc, and iron. A series of beautifully-crystallized salts of potash, soda, and magnesia, completed this magnificent collection.

C. HUMFREY (78, p. 196) exhibited colours produced by the combination of fatty acids with metallic oxides.

T. J. HUSKISSON, of Philadelphia (U. S. 49, p. 1435), exhibited his calcined magnesia.

J. W. and H. HUSKISSON (86, p. 196) were awarded the Prize Medal for a beautiful collection of the principal salts used in pharmacy, manufactured by them. It included Rochelle salt, carbonate, bicarbonate, and phosphate of soda; nitrate and bicarbonate of potash; iodide of potassium, of which some very fine crystals were exhibited,—with the iodides of lead and mercury, and tartaric and citric acids.

C. JÄGER, of Darmstadt (167, p. 1078) exhibited an excellent specimen of salic acid.

H. J. JENKINS (99, p. 192) exhibited starch, gums, and vegetable wax from the potato.

WILLIAM HARRY JENKINS (43, p. 193) exhibited arsenical powders intended to protect wood, &c.

F. JOBST, of Württemberg (4, p. 114), one of the first great manufacturers of quinine, obtained the Prize Medal for a case of that substance, which he exhibited. It was Mr. Jobst who established the identity of theine and caffeine.

J. R. JOHNSON (60, p. 194) obtained Honourable Mention for his extract of "munjeet." This is a substitute for madder, furnished by the roots of another plant, *Rubia cordifolia*.

WILLIAM JOSEPH KANE, of Dublin (53, p. 193), exhibited salt-cake (sulphate of soda), made in brick furnaces, with complete condensation of the muriatic acid, in a concentrated state; also bleaching powder, made from the muriatic acid so obtained. The manganese used by Mr. Kane is found in the Glandore Mines, Cork, and contains 90 per cent. of the pure binoxide.

THOMAS KEATING (102, p. 197) exhibited the flowers of the *Drageria anthelmintica*, from Abyssinia (a celebrated remedy for tape-worm), also Matico, a new astringent and styptic, and other pharmaceutical substances, which obtained Honourable Mention.

JAMES HENRY KENT, of Stanton, near Bury St. Edmunds (90, p. 196-97), obtained the Prize Medal for his dried pharmaceutical plants. This is a beautiful collection: the dried flowers of colechicum, digitalis, and ulva, retain the brilliant hues of the fresh flowers; the powder of conium is of a beautiful green colour.

JOHN KIRK, Harlet and Campsie Alum Company, Glasgow (13, p. 188-89), was awarded the Prize Medal for his alum and prussiates of potash. All the salts were remarkable for their beauty and purity. The crystals of the red prussiate were not coloured dark and rendered impure by any admixture of insoluble cyanide of iron, and were perhaps the finest in the English Department. The alum was prepared from the aldin-shale of the Scotch coal-field by the old process.

WILLIAM WARDRY KING (84, p. 196) exhibited his effervescent citrate of magnesia.

KINZELBERGER and Co., of Prague (27, p. 1008), obtained Honourable Mention for a complete collection of the colours used by painters.

KRIMMELBEIN and BREDT, of Barmen, Prussia (457, p. 1076), exhibited a good series of chemical products and colours for dyers and calico-printers; among which was included red prussiate of potash. A curious circumstance has been stated respecting the prussiate, namely, that red prussiate is sent from Germany to England, while the yellow prussiate is imported into Germany from England in considerable quantity.

KUHLMANN, BROTHERS, chemical manufacturers, of Lile (555, p. 1205), obtained the Prize Medal for an interesting assortment of salts of the alkalis and earths, in which, besides the usual articles of great consumption in a pure form, was included caustic baryta, which is prepared at a singularly low cost from the nitrate, the nitrous fumes being economised in the sulphuric acid chamber. The baryta is employed to precipitate sugar from the juice of the beetroot, in Dubrunfaut's new process of purification. Also, artificial carbonate of baryta, prepared from the sulphate, which is first converted into sulphide of barium, and then exposed in a damp state to the action of carbonic acid gas, obtained by the combustion of coke. Professor F. Kuhlmann has discovered that the hydrosulphuric acid, set free in the operation referred to, can be economically converted into sulphuric acid, by transmitting a mixture of that gas and air in sufficient quantity through nitric acid. Among the less usual products are sulphite of soda and sulphite of lime, obtained by exposing crystallized carbonate of soda, or hydrate of lime, to the fumes of burning sulphur. A liquid ammoniacal mixture for manure was also exhibited, which is produced by conducting the non-condensable gases from the leaden chamber through channels kept moist by the ammoniacal liquor of gas-works or by urine.

Dr. L. KUNHEIM, of Berlin (13, p. 1048), was awarded the Prize Medal for an elegant collection of chemical products, chiefly of the class used in dyeing,—such as

crystals of sugar of lead, nitrate of lead, acetate of lime, stannate of soda, cyanide of potassium, oxide of uranium and tungstic acid in large quantity. The latter substance is exhibited by several manufacturers, probably with the view of having it tried as a substitute for peroxide of tin, in some dyeing processes.

C. A. KURTZ, of Cornbrook Works, Manchester (9, p. 187), had the Prize Medal accorded to him for new colouring matters and preparations for painting and dyeing cotton, linen, silk, and wool.

KUTZER and LEHRER, of Prague (24, p. 1008), obtained Honourable Mention for the ultramarine which they exhibited. They also presented chrome-orange and chrome-yellow of fair quality.

COUNT F. DE LARDEREL, of Tuscany (35, 1294), obtained the Council Medal for his highly-successful manufacture of boracic acid.

HENRY LANPLOUGH (71, p. 195) exhibited a variety of pharmaceutical preparations, together with residual salts from the destructive distillation of animal substances.

WILLIAM LAWRENCE (56, p. 193) exhibited specimens of cod-liver oil manufactured by him.

ALFRED LEA (105, p. 198) exhibited "myrrhuine," a preparation for medical use.

F. M. C. LEAL, of Portugal (p. 1308), exhibited a collection of metallic salts (65, 67, &c.), remarkable for its number and variety. Other exhibitors, of the same country, sent crude and purified cream of tartar: an important article of commerce in wine-growing countries like Portugal.

CHARLES LEE (69, p. 195) exhibited a new black dyeing material for dyeing silk, imported by him.

THE LEEREN CHEMICAL MANUFACTORY, near Drontheim (39, p. 1352), exhibited a well-crystallized sample of bichromate of potash, a salt which is produced there of excellent quality.

T. LEVEVRE and Co., of Moulins-Lille (580, p. 1205), were awarded the Prize Medal for their superior white lead.

— LÉVEVRE, sen., of Nantes-sur-la-Fosse, Loire Inférieure (581, p. 1205), exhibited oxide of zinc of superior quality, for which he received Honourable Mention.

T. LEITCH, of Upper Clapton (67, p. 194), exhibited specimens of dyes for silk, manufactured by him.

— LEROUX, Vitry le François, Marne (308, p. 1191), the discoverer of "salicine," had the Prize Medal accorded to him in acknowledgment of the value of that discovery. A large quantity of the substance, very white and finely crystallized, was exhibited, with a specimen of the willow bark from which it is derived.

C. LEVYKUS, of Wernels-Kirchen, Prussia (875, p. 1097), stood high as an exhibitor of ultramarine, and had the Prize Medal awarded to him for that substance.

G. LINDRAY, of Sunderland (16, p. 189), obtained Honourable Mention for sulphate of iron, of superior quality, manufactured from the iron pyrites of coal mines, exposed to air and moisture, the excess of acid being saturated by digesting the lixivum upon waste iron. Copperas, so manufactured, is sought for by dyers, it is said, on account of its rapid oxidability in the atmosphere.

J. LINKLATER (82, p. 196) exhibited cod-liver oil.

THE LONDON DRUGGISTS (11, p. 199) contributed a large, systematic, and highly-instructive collection of drugs, which received the approbation of the Jury.

WILLIAM LONGMAID (Class I., 44, p. 162) illustrated his new soda-process, for which the Council Medal was awarded, by specimens of the rock-salt from Cheshire, and cupreous pyrites from Cornwall, employed by him; the salt and ore mixed and ground; sulphate-ash, the calcined product of the former, containing sulphate of soda, chlorides of silver and copper, oxides of tin and iron, &c.; black ash, crude alkali, and carbonate of soda, prepared from the sulphate of soda; sulphate of copper, obtained by oxidizing precipitated copper, and treating it with sulphuric acid; bleaching powder, the chloride of which was obtained by passing a current of dried air through a close furnace, heated externally, in which the ore and salt are in process of calcination.

MORITZ LUCAS, of Camersdorf, near Hirschberg (8,

1, Zel., p. 1045), obtained Honourable Mention for his cinnaabar, of which fine and deep-coloured specimens were exhibited.

CHARLES McCULLOCH (96, p. 197) exhibited an interesting collection of English and American dried herbs and roots.

J. F. MACFARLAN and Co., of Edinburgh (107, p. 198), obtained the Prize Medal. They exhibited a series of preparations, on a large scale, illustrative of the manufacture of the salts of morphia, gallic and tannic acids, sulphate of biterine, from green-heart bark; all excellent specimens.

MAIRE and Co., of Strasburg (317, p. 1192), obtained Honourable Mention for their vinegar and other acetous products. They were, also, exhibitors of white lead, of good quality, and of purified alcohol from potatoes.

• DR. L. C. MARQUARDT, of Bonn (327, p. 1069), exhibited several remarkably pure chemical products, including chloroform, cyanide of potassium, bisulphide of carbon, and concentrated acetic acid, for which Honourable Mention was accorded.

MRS. B. MASON (77, p. 195) exhibited Pooloo's Chinese cement.

CHARLES MASON and SON (22, p. 190) exhibited specimens of blacking, of French and waterproof varnishes, manufactured by them.

JOHN MARSHALL, of Leeds (68, p. 194, 195), obtained Honourable Mention for his archil, and various other preparations from the lichens, and for lac-dyes.

MATHEUS and WEBER, of Duisburg, in Prussia (464, p. 1077), were awarded the Prize Medal for chemical products, chiefly intended for the use of bleachers and paper-manufacturers, of which fine samples were exhibited, namely, hydrochloric acid, chloride of lime, sulphite, and other salts of soda, including caustic soda.

MAY and BAKER, of Battersea (14, p. 189), had the Prize Medal accorded to them for their acids, salts, metallic and other preparations used in pharmacy, all of which appeared to be of excellent quality. Their refined camphor was beautifully transparent.

CHARLES MEISSONIER, of Paris (916, p. 1224), had the Prize Medal awarded to him for chemical products of superior quality, including extracts and solutions for dyeing wool in a single operation.

THE MELINCERTHAN CHEMICAL COMPANY, of Neath, South Wales (2, p. 185), illustrated their manufacture of acetate of lead by a splendid exhibition of the crystallization of that substance, which obtained Honourable Mention.

METZGER and Co., of Paris (925, p. 1224), exhibited carefully-prepared pharmaceutical extracts, obtained by steam, and a variety of medicinal substances, reduced to impalpable powder, for which the Prize Medal was awarded.

ALFRED MICHEL, of Puteux, near Paris (640, p. 1208), exhibited the extracts of various dye-woods of superior quality, for which the Prize Medal was awarded.

T. MILLER (1, Class XXX., p. 820) exhibited a complete assortment of artists' colours and materials, which received Honourable Mention.

W. MONERLEY, of the Mulgrave Alum Works, near Whitby (17, p. 189), was awarded the Prize Medal for his alum, prepared from the alum-slate of that district, and sulphate of magnesia, extracted from the residual liquors of that manufacture.

A. MORCAU, of Paris (325, p. 1192), exhibited products of distilled bitumen, for which the Prize Medal was awarded.

MORSON and SON (106, p. 198) exhibited a beautiful collection, for which the Prize Medal was accorded, consisting chiefly of the rarer organic compounds; finely-crystallized salts of morphia, strychnine, cinchonine, and pure acouitine; also veratric, gallic, tannic, hippuric, salicylic, meconic, pyrogallie, and pyromeconic acids; creosote, the furfural of *Fomes*, furfuranide, nitrate of furfurine, chloride of nickel, &c.

C. MORRET, of Paris (932, p. 1224), exhibited superior archil prepared for the use of dyers and calico-printers.

SIR JAMES MURRAY, M.D., of Dublin (87, p. 196), exhibited various fluid and solid preparations of magnesia.

Professor C. MUSSINI, of Florence (37, p. 1294), obtained Honourable Mention for colours, mixed with a peculiar preparation, which prevents the action of the sun and the effects of moisture. The colours are used for encaustic painting and painting in fresco.

WILLIAM NAYLOR (35, p. 191) exhibited various varnishes of copal, sandarach, and mastic, and also specimens of deal wood stained in imitation of different woods, without the usual sizing.

NISSEN, HILLARY, and PARKER (36, p. 191), exhibited tinted paper, chemically prepared in the pulp, for printing cheques upon.

W. G. NIXEY (142, p. 199) exhibited a specimen of cement.

K. OEBLER, of the Grand Duchy of Hesse (8, p. 1126), received Honourable Mention for his products of gas-tar, obtained by fractional distillation. The term "creosote," is applied rather indefinitely, in Germany, to substances which may have an equal medicinal value, but differ considerably in properties. The crystallized creosote of this collection is hydrate of phenyl. The colourless oil appears from its odour to be chiefly benzole.

CHARLES OWEN, of Edinburgh (83, p. 196), exhibited specimens of pure cod-liver oil.

ROBERT OXLAND, of Plymouth (225 and 485, Class I., p. 143, 172), exhibited a variety of products derived from the distillation of peat in cast-iron retorts, which received Honourable Mention. The process invented by Mr. Oxland for the separation of tungstic acid from the ores of tin, by the action of sulphide of sodium and formation of soluble tungstate of soda, in a reverberatory furnace, also received the commendation of the Jury. Specimens of sugar were likewise exhibited, refined by means of acetate of alumina.

S. OYLER (113, p. 199) obtained Honourable Mention for excellent lint for surgical purposes, which he exhibited.

W. PARROTT (46, p. 192) exhibited illustrations, in oil and water colour, of a new brown, derived from the smut of corn, discovered by him, and recommended from his experience of it as an artist.

WILLIAM WATSON PATTISON, of Gateshead, Newcastle-upon-Tyne (18, p. 189), in partnership with a Juror of this Class, exhibited large masses of crystallized alum, masses of the simple sulphate of alumina, known in commerce as "concentrated alum," with a specimen of bicarbonate of soda, prepared by exposing crystals of the carbonate to carbonic acid gas. All were manufactured at the Felling Chemical Works.

OTTO PAULI, of Carlsruhe (328, Zol. 1, p. 1069), had the Prize Medal awarded to him for his phosphorus and other chemical products. The substances exhibited were chiefly derived from bones and animal matters, and included sal-ammoniac and the ferrocyanide of potassium, beautifully crystallized. The last salt was remarkable for its pale sulphur colour, an indication of value, as it arises from the entire absence of the red salt, which, in some dyeing processes, makes the colour appear dull by forming the green cyanide of iron. The annual production of prussiate of potash, in this old and increasing establishment, is about 80 tons; of sal-ammoniac about 20 tons; and of phosphorus 80 cwt.

G. PEACOCK, of Southampton Docks (73, p. 109), exhibited wood, preserved by a chemical process peculiar to himself.

PALEGRINI SNEIDER, of Rome (3, p. 1245), exhibited the native alum of the Roman States, purified by crystallization, showing that this ancient manufacture still maintains its ground, in competition with the enormous production of the same salt by the artificial processes.

MONES HAIM PICCIONTO (33, p. 190, 191) obtained Honourable Mention for specimens of gum-arabic, decolorized and purified by means of sulphurous acid.

PINRO, PATEZ, and Co. (121, p. 199), exhibited very fine state of red, which received Honourable Mention.

THOMAS CADDY POND (25, p. 190) exhibited a marking ink.

PONTIFFER and WOOD (3, p. 185) obtained the Prize Medal for specimens of various colours and pigments employed by artists and paper-stainers, and for other

chemical products. The crystallization of their tartaric and citric acids was truly magnificent, and also their sulphate of copper. They likewise exhibited a series of interesting chemical and metallurgical products, illustrating the different processes of separating lead from its ores, and its subsequent conversion into white lead.

POORTMAN and VISSER, of Schiedam, in Holland (2, p. 1142), one of the oldest houses in the white lead trade, obtained Honourable Mention for the superior quality of the samples of that substance which they exhibited.

M. POUND (108, p. 198) received Honourable Mention for the new drug, "Indian bael," the fruit of the Bengal quince, which he has introduced; and for other pharmaceutical preparations.

POWERS and WIGHTMAN, of Philadelphia, United States (262, p. 1402), had the Prize Medal accorded to them for a large and valuable collection of chemical substances; among which appeared piperin, narcotine, morphine, the valerianate of morphine, and a large quantity of a substance said to be memspermine.

A. PRAT and F. AGARD, Aix (Bouches du Rhône) (1682, p. 1257), exhibited (in illustration of the process of M. Balard for extracting potash from sea-water, for which the Council Medal was awarded) specimens of the various salts contained in sea-water; chloride of sodium in large crystals, obtained from spontaneous evaporation; and the same in a granulated condition, for table use, by dissolving in a hot solution of chloride of magnesium, and cooling.

The Rev. J. B. READE, of Stone Vicarage, Aylesbury (34, p. 185), exhibited cyaniodide of iron, a new variety of soluble Prussian blue, and pure iodide of potassium. In the composition of the former substance, iodine is supposed to play the part of oxygen or cyanogen.

REEVES and SON (7, Class XXX., p. 821) exhibited various water-colours, prepared with wax, and other pigments, which received Honourable Mention.

RICHARDSON BROTHERS and Co. (19, p. 189) exhibited specimens of refined salt-petre, or nitrate of potash, obtained chiefly from the East Indies. The Bengal nitre, so refined, is a remarkably pure potash-salt.

Professor MICHELE RIDOLFI, of Lucca (36, p. 1294), had the Prize Medal accorded to him for his improvements in the colours for encaustic painting; which were accompanied by paintings executed by him to show the effects of the colours.

E. RILEY (123, p. 199) exhibited hippuric acid, prepared in large quantity.

W. ROBERTSON, of Banff (81, p. 196), exhibited cod-liver oil, said to be extracted by steam-heat, and rendered almost colourless without the use of charcoal, or any other decolorizing agent; also skate-liver oil, manufactured in the same manner, which is preferred by some to cod-liver oil for medicinal use.

ROBERTSON and Co. (6, Class XXX., p. 821) exhibited various colours for artists, which received Honourable Mention.

J. ROGERS (240, Class I., p. 143) exhibited various products of peat, which received Honourable Mention.

F. ROHR, of Wiesbaden, Nassau (7, p. 1132), was an exhibitor of ultramarine, distinguished by a Prize Medal.

ROCHAZ, of Mülheim on Ruhr (1 Zoll. 452, p. 1076), exhibited white oxide of zinc of good colour, produced directly from German calamine.

C. P. H. ROSSELET, of Paris (1452, p. 1245), exhibited a chemical preparation for restoring gold and silver embroideries, with illustrations; which received Honourable Mention.

ROWNEY and Co. (3, Class XXX., p. 820) exhibited the pigments used in oil and water-colour painting, with several new colours, which received Honourable Mention.

THE ROYAL SAXON CHINA MANUFACTORY, at Meissen (p. 1112), first prepared ultramarine in Germany; and has exhibited samples of remarkable beauty, for which a Prize Medal has been awarded.

THE ROYAL SAXON SMALT WORKS, at Schneeberg (p. 1105), contributed specimens of their well-known products.

RUSSELL and ROBERTSON, Holytown, Lanarkshire (59, p. 193), exhibited specimens of white lead, said to be pro-

duced by a new and rapid humid process; yellow chromate, and red dichromate of lead, for which they received Honourable Mention.

M. SALUCK, of Sardinia (16, p. 1302), obtained Honourable Mention for his pharmaceutical collection, which included a series of steaoptens, well crystallized from oil of peppermint and other essential oils.

—SANTIN, of the Government of Kaluga, Russia (28, p. 1367), received a Prize Medal for salts of lead of good quality, which he contributed, together with a small collection of other chemical products.

AMBROSIO SAANTO, of Matanzas, Cuba, Spain (242, p. 1344), exhibited an interesting collection of pharmaceutical preparations, which received Honourable Mention.

W. SATTLER, of Schweinfurt, Bavaria (14, p. 1099), received Honourable Mention for a rich assortment of lac colours and other pigments.

J. SETZER, of Weiteneggk, on the Danube (23, p. 1008), represented the manufacture of ultramarine in Austria. He also exhibited the yellow sulphide of cadmium of great purity and intensity; with a collection of madder colours. An Honourable Mention has been awarded to him.

SAVORY and MOORE (115, p. 199) exhibited *kousso*, imported from Aden, also *sumbul*, or musk-root, supposed to be the produce of an umbelliferous plant of Central Asia, the introduction of which into pharmacy in this country is due to the exhibitors.

C. SCHLIPPE, of Moscow, Russia (27, p. 1367), had the Prize Medal accorded to him for superior russiate of ash and alum. This exhibitor is known in science as the discoverer of the crystallized sulphostibite of sodium ( $\text{NaS} \cdot \text{SbS}_2$ ), and manufactures on a large scale. His chemical products are much esteemed in Russia. Besides those mentioned, the collection contained salts of tin; oxalic, tartaric, and acetic acids.

SCHILLING and SUTTON, of Brighton (52, p. 193), exhibited samples of the soda, Seltzer, and Fachingen waters manufactured by them.

STURVE and Co., of Brighton (52A, p. 193), exhibited specimens of the artificial mineral waters which they have long manufactured with so much accuracy, namely, waters of similar composition to the springs at Spa, Pyrmont, Marienbad, Kissingen, Seltzer, Fachingen, Püllna, and Vichy. These factitious chalybeates are said to contain carbonate of iron in solution, whereas in those imported a part of the whole is precipitated.

SCHROCK and UHLICH, of Bamberg, in Bavaria (15, p. 1099), received Honourable Mention for ultramarine of superior quality.

SCHUR and KOHRING, of Brandenburg, contributed pure tartaric acid, well crystallized, and also in fine powder.

L. SCOTT (61, p. 194) had the Prize Medal accorded to him for white oxide of zinc, manufactured as a substitute for white lead.

H. SIEGLE, of Stuttgart (6, p. 1114), was awarded the Prize Medal for an assortment of rich and pure red lakes.

SELOPIS BROTHERS, of Turin and Brozzo (Ivrée) (4, p. 1302), sustained the chemical reputation of Sardinia by the exhibition of a collection of salts, sulphur, salt-petre, and acids. They also exhibited fine samples of phosphorus.

SERZENDELLO and Co., of Portugal (17, 38, &c., p. 1308), exhibited a full series of well-prepared salts, and other chemical products.

A. SCHARNEWER, of Neustrelitz, Mecklenburg Strelitz (3, p. 1134), exhibited a fine assortment of madder-lakes, prepared by a new process, which it is said resist the action of light; for which a Prize Medal was awarded.

A. E. SCHNEIDER (9, p. 187) exhibited different varieties of ultramarine of fine quality, for which a Prize Medal was awarded to him.

T. and H. SMITH, of Edinburgh (94, p. 197), had the Prize Medal accorded to them for aloin, the cathartic principle of aloes, first prepared by them; and for cantharidin, of which a large quantity was exhibited in crystals.

—SOREL, of Grenelle, near Paris (1090, p. 1227), obtained the Prize Medal for his various qualities of oxide

of zinc. M. Sorel has contributed most materially to the rapid advance which the oxide of zinc has lately made in France and elsewhere, as a substitute for white-lead.

Messrs. STENCE and DIXON, of Pendleton Alum Works, near Manchester (7, pp. 185, 186), received Honourable Mention for their alum, prepared from gray schist by the action of sulphuric acid and the addition of sulphate of ammonia. Sulphate of iron, prepared by combining sulphuric acid directly with the residuary oxide of iron of burnt pyrites, was also exhibited; together with a hydraulic cement prepared from the refuse gas-lime, united with the refuse of the shale, after the alumina has been extracted; and the refuse of Wicklow pyrites, after its use in the manufacture of sulphuric acid—from this latter substance the mortar obtains oxide of iron. The metallic salts present are said to prevent the growth of moss upon the surface of this cement.

JOHN ALEXANDER SPENCER (31, p. 190) had the Prize Medal accorded to him for the various products of his chemical manufactory, including naphthalene, sulphate of magnesia, benzoic acid, hydriodate of quinine, and samples of cod-liver oil, which have kept their colour well for one or two years.

T. SPURGIN, of Saffron Walden (38, p. 191), exhibited the roots, stems, flowers, and stigmata of saffron.

PETER SQUIRE (93, p. 197) was awarded the Prize Medal for a variety of pharmaceutical extracts and preserved juices of medicinal plants prepared with great care; and for other chemical products.

HENRY STEVENS (74, p. 195) exhibited samples of deal stained in an ornamental manner, by colours manufactured by himself.

J. C. STEVENSON, of the Jarrow Chemical Works, South Shields (122, p. 199), illustrated the crystallization of carbonate of soda by a magnificent specimen of that salt, which was received too late to be placed among the articles referred to the Jury.

WILLIAM STEVENSON, of the Jarrow Chemical Works (20, p. 189), received Honourable Mention for bicarbonate of soda, prepared by exposing crystals of soda to carbonic acid gas.

STOHMANN and WÜSTENFELD, of the Chemical Manufactory of Neusalzwerk (460, p. 1077), had the Prize Medal accorded to them. They operate chiefly upon the mother-liquor of salt springs, as at the older establishment of Shönbeck. The great variety of substances produced in Germany at the same works may be judged of by the following enumeration of the articles exhibited by this house, with their respective prices. The thaler may be taken at 2s. 10d., and contains 30 sgrs.; the sgr. will be equal to 1/33 of a penny:—

Pure sulphate of zinc, per lb., 3½ sgr. Acetic acid (1·040 and 1·060), phosphoric acid, chloroform, respectively 26 sgr., 1 thaler 13½ sgr., and 1 thaler 25 sgr. per lb. Nitric, sulphuric, purified hydrochloric acid (1·120); per 100 lbs., respectively 10, 12½, and 5 thalers. Carbonate of soda (99·95, and 99 per cent. pure carbonate); per 100 lbs., 7, 6½, and 6 thalers 5 sgr. Ditto crystallized, pure crystallized, and sesquicarbonate of soda; per 100 lbs., respectively 2 thalers 25 sgr., 10 thalers, and 8 thalers. Sulphate of soda; per 100 lbs., 1½ thaler and 2 thalers. Ditto purified; per 100 lbs., 4 thalers 1 sgr. Hyposulphite of soda, per lb., 8 sgr. Nitrate of soda; per 100 lbs., 11 thalers. Seignette salt, per lb., 7½ sgr. Acetate of potash, purified, per lb., 2½ sgr. Carbonate of potash, per 100 lbs., 14 thalers and 30 thalers. Ditto purified, per lb., 1 thaler. Prussiate of potash, per lb., 20 sgr. Sulphate of potash, per 100 lbs., 9½ thalers; crystallized, 40 thalers. Cyanide of potassium, prepared according to the process suggested by Liebig, per lb., 1 thaler 10 sgr. Soda-salt, of the salt water of Rehme, per 100 lbs., 3 thalers; mother-lye, of the same, 180 quarts, 5 thalers. Bleaching powder, 100 lbs., 6 thalers. Sulphate of soda; per 1,000 lbs., 2 thalers 5 sgr.

STRATING and Co., of Groningen, Holland (3, p. 1142), old makers of white-lead by the Dutch method, obtained Honourable Mention for the superior quality of their samples.

J. and E. STURGEON, of Birmingham (119, p. 199), ex-

hibited the red or amorphous phosphorus of Schrötter, manufactured by them; for which the Prize Medal was awarded.

JOSEPH STIMMER, of Kettling (88, p. 196), exhibited a preparation for preserving the turnip plant from the ravages of the fly (*Mallica nemorum*).

M. B. TENNAKT, of Brighton (101, p. 197), exhibited a species of varnish of a silvery blue, for labels or artists' designs.

TENNANTS, CLOW, and Co., of Manchester (7A, p. 186), exhibited a good collection of calico-printers' salts; including sulphate of copper, sulphate of zinc, chloride of tin in crystals, bichloride of tin, nitrate of lead, bichromate of potash, yellow and red prussiates of potash, chlorate of potash, gaulthine, stannate of soda, soda-ash, bisulphate of soda, sal-ammoniac, and pink salt, for which they received Honourable Mention.

J. THRX, of Exeter (125, p. 199), exhibited extract of henbane, prepared from the wild herb.

TRUMAN, HANBURY, BUXTON, and Co. (91, p. 197), illustrated ale and porter brewing by specimens of the materials employed, and of the products obtained.

A. T. TULLOCH, of the Royal Gunpowder Mills, Waltham Abbey (21, p. 189), obtained Honourable Mention for the magnificent and extremely remarkable crystallizations of sulphur which he exhibited.

J. TUSTIAN, of Melcombe, near Banbury (97, p. 197), exhibited petals of the red rose, confection of the red rose, and extract of henbane, prepared by him.

TUSTIAN and USHER, of Melcombe, near Banbury (98, p. 197), exhibited English rhubarb grown by them. This Banbury rhubarb is the produce of the *Rheum rhaponticum*.

The VIELLE MONTAGNE ZINC MINING COMPANY, of Liège, Belgium (26, p. 1152), obtained the Prize Medal for fine white oxide of zinc.

WAGENMANN, SKYBEL, and Co., of Vienna (19, p. 1007, 1008), and the Prize Medal awarded to them for a fine collection of salts chiefly used in pharmacy.

O. W. WALDTHAUSEN, of Larenburg, near Cologne (320, p. 1069), manufacturer of white lead, contributed superior specimens of that article.

Dr. N. WALLICH, of London (pp. 884, 885), had the Prize Medal awarded to him for his great collection of Indian woods, which included specimens of the trees furnishing dye-stuffs, resins, oils, and different medicinal substances.

JOHN WARD, of Ramelton, County Donegal (89, p. 196), was awarded the Prize Medal for the usual products from kelp, including iodine, chloride of potassium, sulphate of potash, and alkali-salt, all of superior quality.

WARD, SMITH, and Co., of Glasgow (54, p. 193), exhibited iodine of good quality, with the salts of kelp, which they manufacture.

WILLIAM WATT, of Dunchattan Chemical Works, Glasgow (82, p. 190), obtained the Prize Medal for iodine and salts of kelp, viz.: sulphate of potash, chloride of potassium, and crude carbonate of soda.

JOHN WATTS (103, p. 198) obtained the Prize Medal for various chemical and pharmaceutical substances manufactured by him, including an interesting collection of extracts prepared in open vessels at a temperature of from 110° to 130° Fahr. The collection embraced the acetic extract of colchicum, from the fresh cornus; extract of gentian, from the dried root; pure aqueous extract of aloes, from hepatic aloes; extract of deadly nightshade, from the flowering plant; extract of li-

quorice, from the fresh root; extract of Turkey rhubarb, from the dried root; extract of fetid goose-foot, from the flowering plant; extract of hemlock, from the flowering plant; eluterium, from the fresh fruit when nearly ripe; inspissated ox-gall; extract of henbane, from the flowering plant; extract of white poppies, from the fresh capsules; extract of dandelion, from the fresh roots, obtained monthly from October to February.

G. D. WENNER, of Venice (16, p. 1007), exhibited samples of fine crystallized cream of tartar, for which he received Honourable Mention.

J. H. WEISS, of Mühlhausen (684, p. 1088), exhibited an assortment of the finest wadder lakes, for which the Prize Medal was awarded.

WERNFELD and Co., of Barmen, Prussia (461, p. 1077), had the Prize Medal accorded to them for a collection of chemical salts, among which, the sulphide of soda, used as an antichlore, was conspicuous.

WETHERELL and Brother, of Philadelphia (43, p. 1435), exhibited a good collection, upon a considerable scale, of salts for pharmaceutical purposes, which was awarded Honourable Mention.

A. WISMANN and Co., of Augustenhütte, near Bonn (334, p. 1070), had the Prize Medal accorded to them for the products of distilled schist. Their liquid products are suitable for illumination; they also obtain paraffin, in quantity, and make good black varnishes for coating iron, &c.

JOHN WILSON and SON, of Hurler, near Glasgow, (6, p. 185), were awarded the Prize Medal for their alum, which magnificent specimens were exhibited, together with a rich series of shales, hair-salt, and other illustrations of the manufacture. Fine sulphate of iron, obtained from the same shale, with sulphate of ammonia from the ammoniacal liquor of gas-works, and fine crystals of naphthaline, formed part of the collection.

WINSOR and NEWTON (28, p. 190) also had the Prize Medal accorded to them for artists' pigments, of which a most extensive collection was exhibited both in the raw and manufactured states.

WOLFF and Co., of Schweinfurt (17, p. 1099), contributed to the display of ultramarines,—remarkable for their cheapness,—for which Germany is distinguished.

WOOD and BEDFORD, of Leeds (47, p. 192), had Honourable Mention accorded to them for their manufactured products from lichens. The preparations used in dyeing were accompanied by several pure chemical principles of the lichens, namely, erythric acid, lecanoric and roccelle acids, pyroerythrin and orcin.

J. YOUNG, of Ardwick Chemical Works, Manchester (7, p. 187), obtained the Prize Medal for his stannate of soda, prepared by the action of caustic soda, aided by heat, upon the native peroxide of tin.

C. ZIMMER, of Frankfurt-on-the-Maine (3, p. 1121), was also awarded the Prize Medal for the alkaloid "quinidine," of which he is the discoverer. M. Zimmer is generally allowed to be the largest manufacturer of the other alkaloids of cinchona bark in Germany or any other country.

J. ZÜCKER and Co., of Rixheim, Haut Rhin (1536, p. 1536), had the Prize Medal awarded to them for their ultramarine, which is remarkable for its fine division and beautiful violet tint. They also supplied a green variety of ultramarine, and a collection of paints.

London, January 1852.

THOMAS GRAHAM, REPORTER.

## CLASS III.

### REPORT ON SUBSTANCES USED AS FOOD.

The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.

#### Jury.

EDWARD DE LOUE, *Chairman*, Russia; Member of the Institute for the Administration of the Domains of the Empire.

Sir J. P. BOILEAU, Bart., F.R.S., *Deputy Chairman*, 20 Upper Brook Street.

JOSEPH D. HOOKER, M.D., B.N., F.R.S., *Reporter*, Royal Gardens, Kew; Botanist.

COMTE HERVÉ DE KEROLAY, France; Secretary of the Central Jury, &c.

JOHN LINDLEY, Ph. D., F.R.S., 21 Regent Street; Professor of Botany, University College.

ASHBEL SMITH, United States; Planter.

IN conducting their duties, the Jurors have adhered to the arrangement of materials proposed by the Royal Commissioners in the Classified Catalogue, with the following exceptions:—

Opium;

Fruits preserved in sugar;

Starches used for manufacturing purposes;

Glue and gelatine;

all of which have been included in other classes.

The Jurors, in the choice of "Experts" (under Instructions, Art. 7, and General Decisions, Art. 29), have been assisted by various eminent merchants, and other persons having the confidence of the public and of the Jury, and who were in no way connected as exhibitors, or otherwise, with the Exhibition.

The "Experts" thus selected, in every instance, promptly placed their services at the disposal of the Jury; and by their zeal and alacrity, by the knowledge and ability they have displayed, the general unanimity of their opinions, as among themselves, and with the Jury—they have rendered to the latter both a service and a kindness, great, in proportion to the responsibility of the duties in which all were engaged.

The divisions of the Sub-classes were considered separately by the Jury, and are separately reported upon here. Allusions have, here and there, been made to "the state of industry of each nation as shown in this Exhibition" (see General Instructions for Juries, Art. 5). Where the materials for any such notices are insufficient, the deficiency is specified. The articles and exhibitors are arranged under—1. British; 2. Colonial; and 3. Foreign contributions; commencing with the Old World.

There were meetings of the Jurors held on about 40 days, their duration averaging about five hours at each meeting, and on no occasion was a day lost from the absence of a quorum.

#### A. I.—COMMON EUROPEAN CEREALIA.

Of the cerealia, commonly cultivated in Europe, viz. wheat, barley, oats, and rye, the Jurors have examined about 500 samples, many of great excellence. These are exhibited in various qualities, and with different objects; some are ears on spikes, for scientific illustration; some, mere specimens, in boxes or bottles, forming important portions of the series of vegetable products that various countries have contributed; and, lastly, there are sacks and barrels of different grain from England, the colonies, and exporting countries in general.

These are unequally distributed, and afford no general information as to the relations between the countries and their produce, nor much as to the importance of their cultivation in the various parts of the world exhibiting them.

Thus, of oats, rye, and barley, which are the staple crops of northern and mountainous Europe and Asia, but very few samples are in the Exhibition: comparatively speaking, wheat is very insufficiently represented from

the United States; better, from our cold and temperate colonies; indifferently from England, Scotland, and Ireland; and hardly at all from the continent of Northern India, where it is a most important winter crop.

There are three collections which appear prominently interesting in this division, and require a particular notice; they are those of Messrs. LAWSON, Mr. MAUND, and Mr. H. RAYNBIRD.

Messrs. LAWSON's collection (165, p. 206) exhibits the ear, grain, &c., &c., of every variety of cereal, and also models of all the roots which it has been found practicable to cultivate in Scotland: the specimens are beautiful, and the arrangement scientific and excellent. No consideration of cost or trouble has been allowed to interfere with providing all that is necessary to render this collection a true and complete illustration of the vegetable products of Scotland. A Council Medal has been awarded to Messrs. LAWSON for their admirably-displayed, very complete, instructive, and scientifically-arranged collection of the alimentary products of Scotland.

Mr. H. MAUND's (79, p. 205) and Mr. H. RAYNBIRD's (74, p. 205) collection of hybrid cerealia are of great interest, from the importance of the process in other departments of the vegetable kingdom, and the known difficulty of hybridizing the cerealia in particular. This arises from the pains required to extract unexpanded anthers from one parent, and to replace them with the pollen of another, preventing at the same time the stigmas to be fertilized from receiving any other pollen than that artificially applied, and guarding them afterwards from the attacks of birds, and a variety of disturbing operations. The result appears, in most cases, to be an offspring stronger than either parent. One wheat has been principally experimented with by Mr. MAUND, and it contains much gluten; but its extended culture has been discontinued by him, owing to a preference for wheats from which a whiter bread may be made. Mr. MAUND's object is, by crossing this cone wheat, to obtain an offspring equally productive, but with more starch in the grain. A Prize Medal has been awarded for the series exhibited. Mr. H. RAYNBIRD exhibits a similar series, for which a Prize Medal is also awarded. This gentleman commenced his experiments, in 1846, with two wheats of very opposite character, the "Herculean," a white wheat of long ear and straw, and fine grain—and the "Eipper's thickset," a coarse red wheat, with thick clustered ear and stiff straw, very productive, but apt to mildew. A few shrivelled ears were first produced. These were planted, and the young plants divided. The produce was copious of all intermediate varieties, some so very like their parents as to be rejected. Picked grains being selected, abundant crops of both white and red hybrids were produced, partaking of the best qualities of both parents.

There are no wheats exhibited superior to the South Australian. This is probably owing to climate, for it appears, after a careful examination of many samples from the best wheat-growing climates, that Spain and certain districts of southern Russia produce hard wheats,

equalling the Australian; whilst the produce of England, of the south of France, of the United States and Canada, hardly fall short of the same high standard. Large allowances have, in many cases, to be made for faulty agriculture, carelessly collected or insufficient samples, and for inefficient methods of threshing, &c., the grain. Such circumstances affect the adjudication of awards, but not perhaps the original value of the crop from which the samples were collected.

1. **BRITISH DEPARTMENT.**—R. WENN'S "Talavera" wheat (72, p. 205) has been awarded a Prize Medal: it is a splendid specimen of English wheat, equalling in value any brought to the market.

H. PAYNE'S "Revitt" wheat (82, p. 205) has also a Prize Medal; it possesses great value, and should wholly supersede the cultivation of the Egyptian Revitt, which is far too abundant in the English market.

J. MACKILGAN, of Cawdor (Scotland), a Prize Medal for excellent white wheat (114, p. 206).

H. R. H. PROCTOR ALBERT exhibits samples of his farm produce (107, p. 206), consisting of "White 'Ludham' wheat," "Augsburg beans," and "Winter oats." The collection deserves a special notice, each of the samples being of excellent quality. A Prize Medal has been awarded to H. R. H. for the oats and beans, the wheat appearing to the Jury to be a little deficient in colour and quality, when compared with other market samples of the same description.

Amongst the other British samples there is little above mediocrity, except the following, of which Honourable Mention is made:

A. SHEPPARD, Ipswich, for good wheat, malt, and barley (70, pp. 204, 205).

The **TRURO LOCAL COMMITTEE**, for samples of various cerealia (71, p. 205) cultivated in Cornwall.

C. GINSON, Pitlochry, Scotland (102, p. 206), for barley grown at an altitude of 600 feet.

J. SUTTON and SONS, for naked barley (142, p. 206).

MOSSE, H. E. and M., exhibit Australian wheat in this department, also deserving of Honourable Mention.

But few malts are exhibited; the samples shown by TAYLOR and SON (77, p. 205) receive Honourable Mention. A sample of porter malt prepared by a "patent process" was exhibited by S. R. POOLL (146, p. 193\*), in which the "torrefaction or roasting" was not carried so far as in the ordinary brown malts, and which is said to contain in consequence a larger proportion of unchanged saccharine matter.

2. **BRITISH EAST INDIA.**—Wheat (870) has from time immemorial been a staple crop in the plains of northern India, and especially in the Punjab; and since the establishment of the studs at Buxar, (Hazepore, &c.), oats have been extensively cultivated. Both are winter (cold weather) crops. The climate and soil are well fitted for these cereals, but owing to defects and carelessness in the agriculture and harvesting, the crops, though excellent, fall short of what most corn-growing countries produce. Further, owing to foul boats and granaries, and to the moist heat of the months immediately succeeding harvest, the wheat reaches England in a state too dirty and weathered for market. There are two samples in the Exhibition, one of hard and one of soft wheat, of which the former is most prized by natives of India, probably for no better cause than that the hardness of the grain more closely resembles their favourite food, rice. Barley is most extensively cultivated in the Himalaya and Tibet, replacing in many districts the wheat; it produces an admirable flour; both are desiderata (as are the oats), which is much to be regretted.

3. **AUSTRALASIA.**—From this quarter of the globe, including VAN DIEMEN'S LAND and NEW ZEALAND, there are splendid samples of wheat, some of barley, and a few of oats.

PORT ADLAIDE stands pre-eminent for wheat and barley. Prize Medals have been awarded both to R. HILLET and SONS (South Australia, S. p. 991), and to HEATH and BROWN (4, p. 998), for wheat, which may be considered perfect as regards growth, equality of grain, colour, weight, and quality.

SWAN RIVER COLONY and PORT PHILIP also send good wheat, but VAN DIEMEN'S LAND seems to rank next to

PORT ADLAIDE, though such that was apparently excellent from the former was spoiled during the voyage. From VAN DIEMEN'S LAND fine white wheats are exhibited by Messrs. DEANE, DRAV, and DEANE, and also by Messrs. M'PHERSON and FRANKY (350, p. 1000), to whom Prize Medals are awarded; the malt also of E. TUOHY, Bagdad (47, p. 993), is considered worthy of Honourable Mention.

NEW ZEALAND is represented by wheat, barley, and malt, all of good character. The barley exhibited by HUGH MARTIN and by THOMAS KENWICK, and the malt exhibited by HOOPER and Co. (89, p. 1002), severally receive Honourable Mention.

4. **CANADA** sends a fine supply of wheats, all of the ordinary English kinds, but every sample of more than average excellence. One barrel of D. CHRISTIE'S white wheat (35, p. 982), sent by the Agricultural Association, has been awarded a Prize Medal, as has one of Polish oats (38, p. 962), of admirable quality, exhibited by R. M. WATTS. The barley is very good. All have the advantage of bearing their prices in the Canada market, showing to what profit they may be exported.

NOVA SCOTIA sends some good red wheat.

5. **CAPE OF GOOD HOPE.**—The soft white wheat exhibited by J. A. BARN (46, p. 951) is of great excellence, and has been awarded a Prize Medal.

6. **JERSEY** contributes a collection of specimen ears, of 104 varieties, &c., of wheats (2, p. 940), accompanied by remarks on the seasons, nature of the crops, &c. A Prize Medal has been awarded to Colonel LI. COURTIEN, the exhibitor.

7. **MALTA.** Honourable Mention is made of the white wheat (4, p. 941) of G. PULIS, Montebello.

8. **BELGIUM.** Although a large display of wheats (there being fully 70 samples exhibited, p. 1150), there are none of any striking superiority. The red wheats are, in general, superior to the white; some "froment blanc d'hiver" is, however, good. Oats and rye are also of fair quality.

9. **FRANCE.** There is no bulk of corn exhibited in this department; and the few samples there are seem chiefly intended as illustrations of manufacturing processes, where gluten is the constituent desired.

A Prize Medal is awarded to HAZIN'S wheats in the ear &c. (1073, p. 1229); an important collection of agricultural produce, containing a new variety of wheat.

Honourable Mention is also made of MAUNIN'S hard wheat, of Auvergne, used in the manufacture of his pâtes and macaronis (3337, p. 1240); also of MABIRE'S English and Russian wheats (1334, p. 1240).

10. **ALGERIA** sends wheat of great promise, amongst which, one, that of LEBELLETIER (33, 1261), has been awarded a Prize Medal. It is a soft fine-coloured wheat of much value.

11. **SPAIN.**—The Spanish wheats, though generally dirty, are unusually fine in quality. Many bottles full are exhibited, but the samples contained are insufficient, and almost universally mixed.

To one particularly fine sample from the Mayor of Medina del Campo (66, p. 1333), a Prize Medal has been awarded. In another bottle the Jury recognized the original stock of the Talavera wheat, probably of a very fine description, but not in a sufficiently satisfactory state for a correct judgment to be pronounced upon it.

12. **PORTUGAL** illustrates her agricultural resources by 80 bottles of cerealia all of fair, but none of particular merit. Her colony of Madeira also sends a sample of wheat.

13. **THE ZOLLERNIN STATES, AUSTRIA, and TUSCANY,** send scarcely any agricultural produce worthy of notice.

14. **DENMARK.**—Barley is now very extensively exported by this country, and is of an excellent description. A sack of good quality is exhibited by H. PUGGAARD and Co. (1, p. 1355), and was found worthy of Honourable Mention.

15. **RUSSIA.**—The collection of Russian cerealia is the finest in the Exhibition, forming a most attractive and prominent display. It consists of fine sheaves of the grains in ear, as cut, and abundant samples of the seeds in bags; all well arranged and catalogued. Count

KOUCHNER (32, p. 1367) has sent the greatest variety, and a Prize Medal has been awarded to his collection in general, in which the black wheat and naked barley, &c., are worthy of particular notice and Honourable Mention. Hard white wheat, from Odessa (42, p. 1367), exhibited by Colonel SHAMELAKY, has been awarded a Prize Medal. This wheat yields a very large crop, and is never grown on manured land, which is considered prejudicial to it. A fine sample of wheat (Arnaout) from the Government of Saratoff, exhibited by — BAOUER (39, p. 1367), has been awarded a Prize Medal. Black wheat (37, p. 1367), a very valuable cereal, cultivated chiefly by the Cossacks of the Azoff Sea; these samples are from the estates of Petrofskaja and Novo Spasskaja, and are awarded a Prize Medal.

Oats from English seed, exhibitor M. SELIVANOFF (52, p. 1368), a Prize Medal.

The following are considered worthy of particular notice and Honourable Mention:—

Hard wheat of Koubanka (60, p. 1368), Lieut.-General Emshoff; and of Arnaoutka (35, 1367), M. KLEPATSKY; pearl barley, Baron Kopp (47, p. 1368); oats, M. OUNKOVSKY (54, p. 1368).

A polentum of half-ripe rye demands notice as a novelty to England, though extensively consumed in Russia.

16. TURKEY.—A large series of considerable merit illustrates the agriculture of this country. It is composed of samples of grain in bottles, too scanty for accurate examination; and many are dirty and carelessly collected. Nevertheless as a collection it is well worthy of attention, and one of the samples, a hard wheat (2149, p. 1386), has been awarded a Prize Medal.

17. EGYPT.—This country grows more millets than corn, but both are copiously illustrated. One sample of white wheat, exhibited by H. H. ABRAHAM PASHA (52, p. 1409), is of admirable quality; it is very large in the grain, and soft, and has been awarded a Prize Medal. The barley is good.

18. TUNIS.—The cereals resemble those of Egypt in kind. Good hard wheats are exhibited, considered of unusual excellence in that country. The skinned barley deserves notice.

19. UNITED STATES OF AMERICA.—The AGRICULTURAL SOCIETY of New York receives a Prize Medal for a well-arranged and instructive series (83, p. 1438) of the wheat corn (in ear), generally cultivated in America. This is illustrated by remarks relating to the seasons, soils, and produce, and suggestive of various improvements in agriculture.

Among many barrels of fine wheats there is one of particular merit, to which a Prize Medal has been awarded; it is a soft white wheat from T. BELL, of Genesee (103, p. 1440), slightly injured by the voyage, but hardly inferior to any in the Exhibition. Among other cereals of the same exhibitor, the red Mediterranean wheat deserves notice. Honourable Mention is made of the wheat exhibited by W. HOTCHKISS (342, p. 1456).

#### A. II.—CEREALS RARELY CULTIVATED IN EUROPE.

Rice, maize, and the *Croix lachryma* (Job's tears) are the chief products that appear to come under this head of millets, &c., being placed in a separate sub-class. As an article of import, rice holds a very prominent place. Maize, on the other hand, has not found much favour in Great Britain, its flour, however cheaply imported, having never perhaps been sufficiently appreciated.

1. GREAT BRITAIN.—Rice requires more sunnier heat than this climate ever affords. Maize has been repeatedly experimented upon, and has been, up to the present time, the fruitful subject of speculation and discussion. Though occasionally successful, the crop is very uncertain, and always scanty. A fair sample is exhibited by the TRURO LOCAL COMMITTEE (71, p. 205).

2. BRITISH EAST INDIES.—Copious samples of about 50 Indian rice are exhibited by the HONOURABLE EAST INDIA COMPANY, and to them a Prize Medal is awarded. Many are of good quality, but more are dirty, small, broken in the grain, and unequal; characteristic of the slovenly state of the Indian bazaars. The quality of

many appears only after boiling. Its size, colour, and fineness of grain, none are at all comparable to the Carolina and Northern Italy rices; several are however very curious, especially the mountain rice, grown without irrigation, at elevations of 3,000 to 6,000 feet on the Himalayah, where the dampness of the summer months compensates for the want of artificial moisture. The small reddish Assamese rice which become gelatinous in boiling, and the large, flat-grained, soft, purple-black "Ketana" rice of Java and Malacca are also very curious. The East Indian maizes are inferior in quality, and deteriorated. BORNEO exhibits a large series of rice, some of them curious.

3. WEST INDIAN POSSESSIONS.—Rice and maize are the staple crops here, but except from British Guiana, the contributions are trifling.

4. AUSTRALASIA.—Maize is exhibited from New Zealand, where it forms an indifferent crop; and from NORFOLK ISLAND.

5. THE CAPE OF GOOD HOPE exhibits maize of fair quality.

6. FRANCE.—The cultivation of rice in Europe is quite confined to the Southern States, and chiefly to the borders of the Mediterranean, where it is extensively grown, and is of good quality. Two varieties are exhibited from Bordeaux, by A. FÉRY (505, p. 1203), to whom a Prize Medal is awarded. One is a beautiful, soft, brittle-bearded rice, irrigated, and called "Nostrana;" the other, unirrigated, is bearded, harder, greyer, and larger in the grain, and is called "Chinese rice." ALGERIA contributes rice and maize of indifferent quality.

7. SPAIN.—The sample of rice from Valencia (72, p. 1333) is equally good with that of Bordeaux, and swells much in boiling; it has been awarded a Prize Medal. Some good maize is exhibited, as also a sample of the seeds of *Cenchrus spicatus*, a cereal little known in Northern Europe, and of no great value.

8. PORTUGAL.—The Carolina rice of M. BELMONTZ, is of good quality, but badly husked and bruised.

9. SARDEGNA.—The *Riz de Piémont* (18, p. 1303), exhibited by BLONDEL, GASTON, and Co., of the same kind and quality as the Bordeaux, has been awarded a Prize Medal.

10. AUSTRIA contributes different varieties of maize.

11. RUSSIA.—Much rice, and of good quality, is cultivated in the southern provinces of this empire. Two samples are exhibited, one unirrigated, from the mountainous districts of the Caucasus; the other is the state of paddy (unhusked) from Odessa. Of the latter, one specimen called Chaltik, from Khalil Beck (57, p. 1368), exhibited by ZILFOGAR BECK ISKANDER BECK OGLI, is worthy of Honourable Mention.

12. EGYPT.—Rice abundant, and of good quality; that cultivated in the Delta of the Nile, at Rosetta, is considered the best; the grain is broad, short, flat, and peculiarly striated.

13. UNITED STATES OF AMERICA.—The American rice, though originally imported from the old world, is now much the finest in quality. The Carolina sample of E. T. FÉRIOT (172, p. 1448) is magnificent in size, colour, and cleanness, and has been awarded a Prize Medal. A beautiful sheaf of beardless rice is also exhibited. Maize is a more important crop in North America than in any other civilized country, being used most extensively for stock feeding; as flour for cooking; and in various forms at table—green, as well as ripe; toasted, boiled, or baked. The collections from America are very fine, particularly that of B. H. KANTLAND (84, p. 1438), who exhibits 34 varieties, amongst which are to be found samples of nearly all those usually cultivated in the United States. A Prize Medal has been awarded to him.

#### A. III.—MILLET AND OTHER SMALL GRAINS USED AS FOOD.

Under this head, besides millets, the Jury have considered buck-wheats: neither are well represented in the Exhibition, though of great importance in many parts of the world.

Buck-wheat belongs to the temperate and Arctic climates, and is cultivated in Northern Europe, Asia, and

America, and most abundantly in Central Asia and the Himalayas; in the latter country the different varieties are grown at various elevations, between 4,000 and 12,000 feet. The finest samples exhibited are from Canada, by E. TAENHOLME (52, p. 962); they are deserving of especial notice, and Honourable Mention. The United States, Russia, and Belgium, also exhibit small samples of good qualities.

Millet, again, are tropical or sub-tropical crops: in India they hold a second rank to rice alone; and in Egypt, perhaps, surpass all other crops in importance. In West Africa they are the staff of life. The Egyptian samples are the finest, and these numbered 90, 91, and 92, p. 1409, exhibited by H. H. ILLIAM PASHA, are deserving of Honourable Mention; they belong to *Holcus sorghum* and *H. scircharatum*, and are known to Europeans as "petit mais."

From India various samples are shown of the different species of *Panicum*, but not labelled in the manner such an instructive collection should be.

CEYLON exhibits millet of fair quality.

The red and white millets of AUSTRIA, RUSSIA, and the UNITED STATES are beautiful, particularly the RUSSIAN samples (60, p. 1368), exhibited by Lieut.-Gen. ERNHOFF, of *Panicum italicum* and *miliaceum*, to which a Prize Medal is awarded.

TURKEY abounds in small grains, and exhibits a large variety of them; but the samples are insufficient and dirty.

#### A. IV.—PULSES AND CATTLE FOOD.

Under this head the Jury have included all leguminous seeds, whether cultivated as food for man or cattle.

The importance of peas and beans is well appreciated, both by the horticulturists and agriculturists in Europe, and our temperate colonies, where, however, they are comparatively of less importance, than the smaller pulses and grains are in various tropical countries,—such as haricots in the Brazils and West Indies,—ground or earth-nuts in South America, and especially in Western Africa,—beans of various kinds amongst the miners of Peru,—gram (*Ervum lens*) and dhal (*Cajanus*), with innumerable varieties of beans and small legils, among the natives of India and Egypt,—and the Cerob bean or St. John's bread (*Ceratonia siliqua*) in the Mediterranean countries. The above are all more or less copiously represented in the Exhibition by the countries named.

In the British Department, LAWSON'S great collection stands pre-eminent for extent and scientific value; and there is also a large one of agricultural produce from Messrs. GIBBS. H. R. H. PRINCE ALBERT'S "Augusta horse-beans," are magnificent, and have been awarded a Prize Medal as part of the collection of agricultural produce alluded to under A. I. W. P. CROUGHTON'S golden pod beans (92, p. 1206) are worthy of Honourable Mention. RAYNBIRD'S tick beans and those of STRANGE are good; as are also FORDHAM'S prolific peas.

CANADA sends peas, beans, and haricots, all of excellent descriptions; and no less remarkable for quality, and colour than for cheapness. The blue imperial peas sent by D. JONES (41, p. 962) would command the highest price in any English market; they have been awarded a Prize Medal, and a like award is given to D. JAMES (40, p. 962), for his fine sample of white peas.

BELGIUM, SPAIN, PORTUGAL, TURKEY, TUNIS, and EGYPT exhibit, each, beans, peas, haricots, pulses, and legumes of all descriptions, but none except the Egyptian beans are worthy of especial notice.

RUSSIA, besides many of these, exhibits green sugar-peas (dried unripe); those exhibited by KHOKHOLKOFF and GUSCOFF (63, p. 1368) are worthy of Honourable Mention for their excellent flavour and sweetness.

#### A. V.—GRASSES, FODDER, PLANTS, AND AGRICULTURAL ROOTS.

Of these, including clover-seeds, &c., there are but very few specimens beyond those in the collections of Messrs. GIBBS and Messrs. GIBBS. The splendid specimen of meadow grass from the Falkland Islands, exhibited by

Messrs. LAWSON, and in full flower, deserves especial notice.

CANADA and the UNITED STATES exhibit clover-seeds and timothy grass. Of these the timothy-grass seed (61, p. 93) of T. MCGILN, Montreal, and the clover-seed (52, p. 93) of G. JEFFRIES, are worthy of Honourable Mention.

Of agricultural roots there are none worthy of mention, except the Portuguese *Cyperus esculentus* of the MARQUIS DE LOULÉ (401 B) be included, which is worthy of Honourable Mention.

BELGIUM contributes hay of fair quality. EGYPT exhibits samples of clover-seed, and TUNIS of hay-seed.

#### A. VI.—FLOURS, AND PREPARATIONS OF THE ABOVE CLASSES.

Under this comprehensive head, the Jury have considered, not only flours properly so called, but various biscuits and semolines, as also pâtes, macaronis, vermicellis, and other manufactured articles referred to them. It is difficult, in many cases, to determine, satisfactorily, which belong to this, and which to the starch series (F).

There are but few English wheat-flours exhibited; and the general remarks made under the head of "cerealia" are equally applicable here;—except that the United States contributions of wheat-flours are really magnificent. Pea and bean flours, and sundry alimentary substances prepared therefrom, find a place here.

1. GREAT BRITAIN.—Amongst the various, but far from extensive, series of flours from this country, Prize Medals have been awarded to—KIDN and PONGER, Isleworth Mills, for Australian wheat-flour (150, p. 193\*). EDWARD CHITTY, of Guildford, for flour of English white wheat (159, p. 193\*). And to BUCK and SON, of Bradford (162, p. 193\*), for oatmeal-flour.

Honourable Mention for particular excellence is also made of the following:—

W. JESON, Shropshire (95, p. 206), for wheat-flour. J. M'CANN, Drogheda (153, p. 193\*), for oatmeal.

ASILEY'S flours of peas, groats, and pearl barley, exhibited by T. STYLES (157, p. 193\*), put up for long voyages, are sound and useful preparations. Inferior macaronis of English manufacture are exhibited by W. LEVY (120, p. 207), and by J. P. GENTILE (108, p. 206), together with glutens and other alimentary substances. A very fine collection of gluten preparations, chiefly of scientific interest, is exhibited by Madame St. ETIENNE (138, p. 208), who exhibits, also, some curious dried alimentary substances, composed partly of flour and partly of meat. BULLOCK'S semola appears to be wheat-flour granulated with gluten. The rice gluten of ORLANDO JONES (128, p. 208) is obtained from rice-flour used for the manufacture of starch, dissolved by caustic soda, and then precipitated by an acid. RECKITT and SON, of Hull, exhibit various starches and sagos (125, p. 208), all apparently derived from potato-flour. D. and W. MILLER'S pithina food, sago-flour, and Scotch fenla seem all referable principally to the same source.

Amongst the curiosities worthy of notice is the Typha meal prepared from the rhizoma of *T. latifolia*, by M. M'CALLUM, of Leith (133, p. 208).

2. CANADA.—Various barrels of excellent flour are exhibited, and also of biscuits; Prize Medals have been awarded to—J. SIMMONS and Co. (48, p. 962), for wheat-flour; R. SQUAIR (51, p. 962), for oatmeal-flour; J. ROBB (126), for biscuits.

The buckwheat-flour exhibited by E. TAENHOLME (52, p. 962) is also very good, and deserves Honourable Mention.

CAPE OF GOOD HOPE.—A sack of very fine flour from this colony merits Honourable Mention; it is from J. F. FREDERICKSEN.

3. AUSTRALASIA.—After what has been said of the cerealia of Port Adelaide, it is not surprising that the flours should prove of equal excellence, as is especially the case with those exhibited by H. E. and M. MOSES (4, p. 997), to whom Honourable Mention is awarded. VAN DYKSEN'S LAND contributes some barrels of excellent wheat flours; one of these from J. WILSON (51, p. 962),

is deserving of Honourable Mention: the others appear to have been injured by the voyage. The New Zealand "Maori flour" (an flour produced by the natives) is deserving of notice. Biscuits an extremely well made as to have been awarded a Prize Medal are exhibited by A. M. MILLIGAN (53, p. 998), of Van Diemen's Land;—these deserve especial notice, from the fact that, at a very recent period, the biscuit served out to the convicts, and to Her Majesty's Navy, when resting in Tasmania, was said to be the refuse of the English Dockyards, and was certainly unfit for food.

6. DEMERARA exhibits maize and plantain meal of good quality.

7. FRANCE contributes a most extensive collection of flours and preparations therefrom; amongst which it is very difficult to select for awards—the specimens are of such variety, as to merit and kind.

The magnificent gruaux wheat-flour of M. D'ARBLAY, jun. (1576, p. 252), has occupied much of the attention of the Jury, not only as the best sample of European flour, but from the exhibitor being the inventor of the gruaux principle in grinding, whereby a great saving of the finest and most nutritive portion of the flour is effected, and any wheat flour made to contain more or less gluten in proportion to starch. Hard wheats of all kinds, especially Sicilian, Russian, and Sardinian, from the large percentage of gluten they contain, are the best adapted for this purpose.\* By means of D'Arblay's adjusting process, such grains are first ground high in the mill; the white middlings are then separated by coarse sieves, and reground low in the mill; finally, the flour is repeatedly passed through fine silk sieves. This process is evidently tedious and expensive; but the flour produced is of the very finest description, especially for pâtes, and other preparations of that description. The average produce of flour thus obtained is 25 per cent. from ordinary wheat. Such flour is extensively imported into this country, for bettering the inferior flours, especially the Irish. D'ARBLAY's household flour, obtained by the usual grinding process, is also of first-rate quality. A Council Medal has been awarded to Mr. D'ARBLAY, "for his gruaux and household flour, obtained by a novel and economical process, for the fineness of its quality and utility."

CADANES and RAMBÉ have been awarded a Prize Medal for their "thirds flour" (1126, p. 1232), and ABEL LEBLANC's "household flour" (297, p. 1191) has been found worthy of Honourable Mention.

Among the great manufacturers of French pâtes, &c., &c., the following have been awarded Prize Medals. J. V. MAGNIN (1337, p. 1240), for macaroni, almost equal to the best Italian; and for wheat, already mentioned amongst the cerealia, and which, from its proportion of gluten, is particularly adapted for pâtes, &c. Mr. MAGNIN also exhibits various flours, with their applications to culinary purposes, all of great excellence. N. D. M. FEVREUX, of Paris, for a fine collection of féculs (209, p. 1198). VÉZON BROTHERS, of Poitiers, for their gluten granulé (1520, p. 1249) and other products; this gluten is composed apparently of flour mixed with gluten and water.

Honourable Mention has been made of the following:—

GRUBLT, jun., Paris (530, p. 1204), for an excellent collection of féculs, including those of rice, chestnut, and parmentines. C. CLERT, de Lille (456, p. 1200), for fine pearl barley, vermicelli, and other preparations. J. M. H. VIOLLETTE, for ship-biscuits (1528, p. 1250), prepared by baking the dough in high-pressure steam.

Besides the above, there are various good collections of similar substances, as those of BEGON BROTHERS (49, p. 1128), who exhibit rice, lentil, and pea flours;—of MACART, a fine series of wheat glutens;—and of NOYE, vermicelli and potato-flours, &c. (1342, p. 1242).

From ALGERIA, a good hard wheat-flour, from LAVA and Co., of Bab-el-Ould (82, p. 1261), of admirable quality, merits Honourable Mention.

8. RUSSIA.—The flours of this country are proverbially good, and those exhibited equally excellent with the collection of cerealia. A Prize Medal has been awarded

to M. ROUSSANOFF (66, p. 1368) for hard wheat-flour. Honourable Mention is made of the Smolensko grits of KARANTSEV (49, p. 1368), prepared from buck-wheat, ground on the gruaux principle, being quite a novelty. Rice-flour is exhibited, as is also a very peculiar coarse Revitt wheat-flour.

9. AUSTRIA.—The wheat-flours of this country, and especially the Croatian, are exceedingly good. Two samples of apparently a gruaux flour, prepared by the PRIVILEGED STEAM FLOUR MILL COMPANY, Vienna (62, p. 1010), have been awarded a Prize Medal. JOHANN and BARBER, of Tetschen, Bohemia (68, p. 1010), exhibited a Croatian flour from a peculiar wheat, which is considered difficult to clean; it is said to yield six to eight quatern loaves per sack more than any other, and has been awarded a Prize Medal. There are various other good flours exhibited by Austria.

10. BELGIUM.—The samples of potato-flour are of unusual excellence, and Honourable Mention is made of that of G. BLUYCKAERTS (78, p. 1153).

11. BAVARIA exhibits a peculiar flour from wheat-grits of exceedingly good quality, but not accompanied by any observations, and probably sent as a curiosity only, by CHRISTIAN AUGUST ERMICH (p. 1099).

12. PRUSSIA.—The potato-flour and sago (332, p. 1076) exhibited by F. WAHL, are of great merit, and have been judged worthy of Honourable Mention for the beauty of the preparations. From the same country WITTEKOP and Co. exhibit a fine series of macaronis and pâtes (695, p. 1089), to which a Prize Medal has been awarded.

13. The NETHERLANDS and the DUCHY of HESSE exhibit pearl barley, groats, flour, &c.

14. SWITZERLAND and SARDINIA contribute pâtes of various kinds.

15. TOSCANY.—The MACARONIS of this country are the finest in the Exhibition, both for flavour, texture, and excellence of manufacture; those of F. PASQUETTI (40, p. 1294) have been awarded a Prize Medal.

16. SPAIN AND PORTUGAL both exhibit good flour of wheat, but the samples are insufficient. There are also macaronis from Portugal.

17. UNITED STATES OF AMERICA.—Very fine samples of flour are exhibited from this country, and of 10 barrels none fall below a high standard of excellence. Two have been selected as worthy of Prize Medals; one of HECKER and BROTHER (114, p. 1440), who also exhibit the maize farina; the other of RAYMOND and SCHUYLER (128, p. 1441). The extra-Genecsee flour of M. S. and H. L. LEACH is also worthy of notice (145, p. 1446). Of maize-flour, commonly called "corn-meal," or "corn-flour," in the United States, the exhibition is very good. The article is extensively used for puddings and other purposes in that country, and is considered peculiarly wholesome and nutritious; more so than rice-flour, which is preferred in England for similar purposes.

HECKER and BROTHER's farina has been considered worthy of Honourable Mention, as has, also, the fécula of the OSWEGO STARCH FACTORY (104, p. 1440), which is produced at a very low price. These, and many other samples, testify to the great importance of this flour as an article of home consumption in America.

Malt made from maize is exhibited, perhaps more as a curiosity than an article of importance, by the ONTO BOARD of AGRICULTURE (24, p. 1434). Good pearl barley is shown by RAYMOND and SCHUYLER (128, p. 1441).

#### A. VII.—OIL SEEDS AND THEIR CAKES.

Of this description of sheep and cattle food there is a tolerable supply in the Exhibition, but no samples of remarkable merit, and only one novelty, the cotton-seed cake. Among the various seeds used in the manufacture of oil-cake, flax (or linseed) is the most important. Rapeseed is also employed, but is considered heating. In the Lubek department a sample is exhibited of the "dodder-cake," made from the *Camelina sativa*. A small portion of inferior poppy-cake is contained in the Indian collection.\* Walnut-cake is not represented at all.

1. GREAT BRITAIN.—The cotton seed-cake, exhibited by R. BERN (of Edinburgh), is a novelty worthy of

especial notice, and was awarded Honourable Mention. The seed is recommended on account of its cheapness, being usually thrown away as refuse by the cotton manufacturers; it is extensively used as a cattle food, in an unprepared state, in various parts of the tropical world, and to a limited extent in England: but its success is doubtful, and in the shape of oil-cake it has possibly not yet been fully tested. Several samples of linseed-cake from Yorkshire are exhibited, some of which are better than ever appear in the London market; they are, however, inferior to the American. Honourable Mention is made of the collection exhibited by T. PETERSON (66, p. 204), consisting of samples manufactured by GEORGE SPUR of Hull, JOHN WOOD of Hull, FEA of Boston, PAYNE of Hull, THIRSK, jun., of Beverley.

2. **BRITISH EAST INDIES.**—Flax is most extensively cultivated, especially in the northern province of India, but chiefly, if not wholly, for the oil expressed from the seed; the oil-cake, as a manufactured article, being unknown. Poppy-cake is, however, occasionally manufactured, and a specimen (of inferior description) is exhibited.

3. **CANADA** exhibits excellent linseed; and the cameline-seed of J. FISHER (59, p. 963) is considered worthy of Honourable Mention.

4. **BELGIUM** exhibits good oil-cakes of various kinds. Honourable Mention is made of the rapeseed-cake exhibited by VERCRUYSE, BROTHERS (91, p. 1154), and of the linseed-cake of J. L. VERCAUTEREN (82, p. 1154).

5. **HAMBURG.**—The rapeseed-cake of J. PETERSON (5, p. 1336) deserves Honourable Mention.

6. **AUSTRIA, the NETHERLANDS, LUBECK, and EGYPT** all exhibit, more or less, oil-cake of fair quality.

7. **SARDINIA** exhibits very good oil-cake of GIRARDI, BROTHERS (5, p. 1302), considered worthy of Honourable Mention. (Mentioned also by Jury of Class IV.)

8. **RUSSIA** sends various good samples of linseed and sesamum; also of rape-seed, of which the sample exhibited by E. KARNITCH (31, p. 1367) is deserving of Honourable Mention.

9. **UNITED STATES OF AMERICA.**—J. BRIDGE of New York (546), and LEE and Co., of Boston (530, p. 1467), both exhibit very fine oil-cake, worthy of Honourable Mention. These are much finer samples than usually reach the English market from America.

#### A. VII.—HOPS.

The best hops are produced in England, and are chiefly cultivated in Kent and Sussex; they are also grown to a limited extent in Surrey, Essex, Suffolk, Herefordshire, Worcestershire, and Staffordshire, the soil and climate of each district giving a peculiar character to the crop. On the continent of Europe hops have been extensively cultivated, but never to perfection, the flowers having generally a rank smell and flavour. The plant has also been introduced into Canada, Van Diemen's Land, and on the Himalaya mountains, with various success. The exhibition is, on the whole, good.

1. **GREAT BRITAIN.**—A Prize Medal has been awarded to J. M. PAINE, for his Farnham Golding's hops (62, p. 204), grown on the phosphoric marl. These are fully ripe, and of fine flavour. The soil of this district is the very finest for the production of hops, but the growers often pull them too green. A Prize Medal is also awarded to RICHARDSON and SON for their collection (59, p. 204), in which the Gravesend hill are fine, and well flavoured; and both the Jones's and Worcesters are worthy of notice. R. GOLDING's hops (63, p. 204) are considered worthy of Honourable Mention.

2. **CANADA** sends the best hops that have ever been imported from that country, and which, had they less of the "currant-leaf" flavour, would fetch a good price in our market. The samples of B. SMITH (64, p. 968), of Stanstead, have been awarded a Prize Medal, and that of THOMAS DUNN and SONS (65) considered worthy of Honourable Mention.

3. **VAN DIEMEN'S LAND** has grown hops for some years, and it has been said, with success; but the specimens now exhibited are hardly recognizable, perhaps

owing to defects in the packing, or accident during the voyage.

4. **BELGIUM** exhibits fair hops and of several varieties; these rank next to the Canadian in point of flavour. The best are the Poperinghe hops exhibited by L. DEGRUYSE (63, p. 1158), WIDOW L. DEQUIDT (64, p. 1153), MADAME VAN MERIE (65, p. 1153), which are severally considered worthy of Honourable Mention.

5. **GRAND DUCHY OF HESSE.**—The Mayntz hops are of good flavour, well harvested, though rather small, and have been awarded a Prize Medal; the exhibitors are STEIN and SCHNÖDER (81, p. 1129). Some Stralsbourg hops are also good, resembling Golding's.

6. **RUSSIA** sends a sample of unripe hops, better than usual, and which, were they sufficiently ripened, would probably rank next to the English in quality. This appears to be a common imported variety of the English "grape hop," and is from COUNT KOUCHELEFF (32, p. 1363):—it deserves Honourable Mention.

#### B.—DRIED FRUIT AND SEEDS.

The series of dried fruits is very extensive, and the articles generally excellent in quality. Little novelty, either in product or import, is remarked, and none of invention in preservation. The divisions of this Sub-Class (B.), proposed by the Royal Commissioners, are not here retained, the articles being considered in the aggregate under each exhibiting country. Those preserved in sugar have been referred to another Jury. (Class XXIX.)

1. **GREAT BRITAIN.**—FORTNUM, MASON, and Co.'s collection of dried fruits, seeds, and other articles used for dessert (55), claims the first place, and has been awarded a Prize Médal. Amongst many samples of the finest fruits are others of greater or less demand in the English market; as,—the Sapucaia, Souari, and Brazil nuts, cashew, jujube, litchi, hickory, pinus cembra, &c. Vanilla, nutmegs, Taffiah and Syrian dates, &c. JOHN CLEMENS (56, p. 204) has been awarded a Prize Medal for magnificent raisins (Malaga) and Jordan almonds. R. and C. FAULKNER (54, p. 204), also, have been awarded a Prize Medal for their preserved fruits in bottles, &c., which, though not dried, can only be introduced in this class. COPLAND, BARNES, and Co.'s collection of fruits (11, p. 201) deserves Honourable Mention. BATTY and FRASER also exhibit good fruits.

2. **IONIAN ISLANDS.**—Dried currants are exhibited from Cephalonia, by MAVROIANNI, equal to the Zante currants.

3. **EAST INDIES.**—Pickled fruits of the "durion," a production of the Straits of Malacca, are exhibited, but no other preserved fruits, except tamarinds, which were extremely good, and some fine candied fruit of the Egle Marmelos.

4. **CEYLON** exhibits tamarinds and myrobalans (the almond-like kernel of the nut of a terminalia); JAVA, tamarinds.

5. **From the WEST INDIAN ISLANDS** there are fruits, entire, of the Brazil nut (*Bertholletia excelsa*), from TRINIDAD; tamarinds and cashew nuts from BARBADOS. DEMARARA sends excellent fresh souari (butter nuts), dry bananas in slices, sweet but very poor; the monkey-pot fruit entire; limes; and bilimbi fruit preserved in pickle.

6. **VAN DIEMEN'S LAND** exhibits good dried apples grown in the colony.

7. **CAPE OF GOOD HOPE.**—A Prize Medal has been awarded to the fine collection of dried fruits from the Cape Colony exhibited by R. CLARENCE (54, p. 952); of these the most remarkable are good sugary pudding raisins, and a small black kind from the Constantia grape; flat dried pears, good; soft-shelled white-meated walnuts of great merit; good but flavourless almonds with formidable shells, and dried sliced peaches and apricots.

8. **FRANCE.**—The contribution is small from this country, except of fruits preserved with sugar.

9. **WURTEMBERG.**—Dried fruits for home consumption, and apparently much appreciated in the country, are exhibited; such as bilberries preserved in great quantities,

which are flavoured; also some apples, pears, and cherries, which are better.

10. PRUSSIA exhibits a case of 24 bottles of dried garden and orchard fruits, good, and well flavoured.

11. SPAIN.—The collection of Spanish dried fruits deserves Honourable Mention for general excellence. There are dried raisins, dried peaches, prunes, and thin-skinned figs, walnuts of great size and good flavour; almonds, Barcelona nuts, ground-nuts, pistachio nuts, chestnuts, and belotes. Of these the following exhibitors have been considered worthy of Honourable Mention:—DON JUAN D'ALVEAR; plums. DON J. R. CASALO; raisins (105, p. 1335). DON JOAQUIN ENRIQUEZ; figs (107, p. 1335). DON JOSE OLMO; peaches (176, p. 1339). The pimientos de vico (Logroño), or sweet capsicum, of R. MANSO (133, p. 1337), likewise merit Honourable Mention.

12. PORTUGAL.—The series from this country is particularly fine, and consists of copious samples put up in large bottles, all of good quality. Those contributed from Villa Real (412—416, p. 1312), by PINTO DA FONSECA VAZ, consisting of plums, figs, pears, peaches, and apricots, have been awarded a Prize Medal. A Prize Medal is also awarded to J. L. GOMES, for his magnificent figs (403, 418, 419, 420, p. 1312); and Honourable Mention is made of the dried pears (404, p. 1312) of PINTO DA FONSECA VAZ. Besides the above, there are from these and various other exhibitors almonds, walnuts, filberts, chestnuts, belotes, raisins, plums, &c.

13. GREECE contributes raisins, currants, and figs; but none of fine quality.

14. TUSCANY sends pine-seeds, an article of great consumption in the Italian provinces.

15. TUNIS.—The collection of dates exhibited by ERTEM MACHSEN (pp. 1415, 1416), including upwards of thirty varieties, all in excellent condition, and in great quantities, has been awarded a Prize Medal. Though dates are not imported into this country from Tunis, that part of Africa is celebrated beyond all others for the variety and excellence of this fruit. There are, also, almonds, raisins, pistachio-nuts, apricots, and figs.

16. EGYPT.—There are seven kinds of dates in this collection, none remarkable. The fruit of the doon-palm (*Crucifera thebaica*) is a novelty; it is commonly called Alexandrian gingerbread, and is much eaten, though worthless as an article of food in English estimation.

17. TURKEY exhibits an extensive series of fruits and small articles for dessert: but all in insignificant quantities, and very dirty. The jujabes are remarkable for size and variety.

18. Of cocoa-nuts there are very few exhibited, and none worthy of notice. CEYLON and the MAURITIUS contribute some. The "double" or "sea cocoa-nut" of the SEYCHELLE ISLANDS, sent from the Mauritius, is a curiosity, but not an edible one.

19. Betel-nuts are exhibited from Sarawak in BORNEO, CEYLON, SINGAPORE, and the EAST INDIES.

Though not ranking as "dried fruits," olives and olive-oil have been included in this division by the Jury; of these the exhibition is admirable. The SPANISH olives are magnificent, both those preserved in oil and in water; and Honourable Mention is made of the "manzanillas a la Rana" of MANUEL CARABE, Seville (172, p. 1335). PORTUGAL also exhibits admirable olives, of which the small black kind of the VISCOUNT DE FONSECA BOA (441, pp. 1312, 1313) merits Honourable Mention. The other exhibiting countries are EGYPT, ALGIERS, and TUNIS. Olive-oil is abundantly exhibited by FRANCE, ALGIERS, TUSCANY, SPAIN, SARDINIA, CORFU, PORTUGAL, MADEIRA, and SOUTH AUSTRALIA; but, amongst great general excellence, there is no novelty or particular merit.

#### C. I.—TEA.

The exhibitors are few in this division, and have confined themselves to imports from the Eastern World, whence this product is, however, admirably illustrated. CHINA tea is exhibited in abundance, and of the finest quality. The BRITISH INDIAN produce, again, has never before been displayed in England as it is here by the

ASIAN TEA COMPANY, and the HONOURABLE COURT OF DIRECTORS of the East India Company, who send good samples of the Himalaya and Java growths in the best condition. The Jury regret the absence of samples from Madeira, and especially from Rio de Janeiro, as also from Chittagong, and various other countries in which the cultivation of tea has been attempted with more or less success.

1. *China Teas*.—The collection formed by P. W. RIPLEY (17, p. 1423), at Canton, expressly for this Exhibition, is quite unrivalled, whether we regard the excellence of the specimens, the completeness of the series, the rarity and costly nature of many of its perishable contents, or the scientific value it possesses from the admirable arrangement followed. Some of the teas exhibited have never before been seen in England; whilst these and others command prices, in the China market, six times greater than the most expensive fetch, when sold retail, in England. Some are so perishable that the voyage injures, and the subsequent keeping and exposure in the Exhibition ruins them; whilst all are curious and highly instructive; circumstances quoted to show how regardless of every consideration but the complete illustration of this branch of commerce Mr. RIPLEY has been.

The Jury regret to find that the rules of the Royal Commissioners preclude Mr. RIPLEY from receiving any stronger proof of the high estimation in which his collection is held than the award of a Prize Medal. The following scanty data are recorded for the information of the public on a branch of industry which has never before been adequately illustrated.

Full chests of various Pekoe teas are exhibited, some of which fetch 50s. per lb. in the China market; whilst 7s. is the very highest price any of the sort will fetch in England, and this only as a fancy article. The plain and orange-scented Pekoes now fetch little with us; but, as caravan teas, are purchased by the wealthier Russian families. The finest, however, never leave China, being bought up by the mandarins; for though the transit expenses add 3s. to 4s. per lb. to the value when sold in Russia, the highest market price in St. Petersburg is always under 50s. Among these scented teas are various Caper tea, flavoured with chloranthus flowers, and the buds of some species of plants belonging to the orange tribe, magnolia fuscata, olea flowers, &c.

The Cong Soucheong, or Ning-young teas, are chiefly purchased for the American market. Oolong tea is the favourite drink in Calcutta, though less prized in England, its delicate flavour being injured by the length of the voyage.

For delicacy, no teas approach those usually called "Mandarin teas," which being but slightly fired, and rather damp when in the fittest state for use, will bear neither transport nor keeping. They are in great demand among the wealthy Chinese, and average 20s. per lb. in the native market. The punchongs, souchongs, and congos better illustrate the English trade, and are of the most admirable description.

Of the Moyune district teas there are eight varieties; they are much prized in the American markets, but not so much so in England. Among the most important curiosities in the collection are the counterfeit teas of Canton. These are made of any refuse, such as moistened tea-leaves from the pot, beat up with gum and rice-water in a mortar, coloured with Prussian blue and gypsum, and curled, twisted, or granulated so ingeniously as to counterfeit the most costly varieties. The gunpowder and scented caper are over-done, the appearance of the counterfeit being more equal and beautiful than the genuine teas ever are.

Various curious teas used by the labouring classes of Chinese are exhibited; some are merely coarse, and bad, sun-dried leaves; better qualities, chiefly from Anko, are put up in baskets and boxes, and exported to the Islands of Java, &c. Curiously rolled and twisted samples, such as the "old man's eyebrows," "ball tea," and other fancy manufactures, are all illustrated. Medicine teas follow these in the series, and consist of cakes, lozenges, &c., made of leaves mixed with various drugs, herbs, liquorice, and sweetmeats.

Lastly, there are specimens of the plant itself, leaf, flower, and bud; models and drawings to illustrate the processes employed in its manufacture, packing, and shipment; samples of the materials used for scenting; tea-pots, cups, &c.

Another collection of merit is that of W. P. HAMMOND and Co.\* (2, pp. 418, 419), which has also been awarded a Prize Medal. This contains, in 40 boxes, the various teas more or less abundantly imported into England; and is further illustrated by good paintings of the processes employed in the culture, husbanding, and manufacture.

2. *Java Teas*.—Exhibited by the SINGAPORE COMMITTEE of the HONOURABLE EAST INDIA COMPANY. These teas are good of their kind, but not equal in flavour to the Chinese, or even to the Kemaon. In respect of flavour, they resemble the Assam, but are inferior in strength.

3. *Kemaon Teas*.—Exhibited by the HONOURABLE EAST INDIA COMPANY (p. 872), are not very fully represented. In flavour these rank next to the Chinese teas; and as a class, have rather the Anko flavour; being better adapted for green tea than black. The manufacture is much improved of late. Three samples are exhibited; imperial hyson, young hyson, and souchong; for the two latter of which a Prize Medal has been awarded.

4. *Assam Teas*.—Eight boxes are exhibited by the HONOURABLE EAST INDIA COMPANY (p. 872); all full of well-made strong teas, superior in this respect to the Chinese, but much inferior in flavour, roasting, and scent. In point of manipulation they equal the Chinese. For mixing with the Chinese article they find a ready sale in the English market; and are in every respect superior to the ordinary tea, than which they command a much higher price. The quantities exhibited in these boxes are too small, and have consequently lost much of their flavour during the voyage and subsequent exposure.

The grey flowery pekoe is the best sample exhibited; in appearance and flower it cannot be surpassed by any China tea, but is rather wiry in the leaf, from the buds having been gathered too young; whence, perhaps, also its deficiency of flavour. It is of a much higher class than that of Kemaon and Java, and would command a high price in the English market. A Prize Medal is awarded to it.

5. *Brick Tea of Tibet*.—A sample of this curious product is exhibited by the HONOURABLE EAST INDIA COMPANY (p. 872). It is formed of the refuse tea-leaves and sweepings of the granaries, blanded, and pressed into a mould, generally with a little bullock's blood. The finer sorts are friable masses, and are packed in paper; the coarser, as this, sewn up in sheep-skin. In this form, it is an article of commerce throughout Central and Northern Asia, and the Himalayan provinces; and is consumed by Mongols, Tartars, and Tibetans, churned with milk, salt, butter, and boiling-water, more as a soup than as tea proper. Certain quantities are forced upon the acceptance of the western tributaries of the Chinese empire, in payment for the support of troops &c.; and it passes from its convenient size and form, brought into circulation as a coin, over an area greater than that of Europe.

6. *Assam Tea*.—Sent by the ANNAM COMPANY, and exhibited in the British Department (141, p. 195\*). This collection is contained in twelve chests: it is admirable, and in perfect order. As the indigenous plant has been manufactured in Assam, and the Chir plant has also been introduced and cultivated for the purpose, the exhibitors have judiciously sent samples of the different kinds of tea from each: thus enabling the Jury to establish the superiority of the introduced Chinese plant over the indigenous (or native Assam) for the manufacture. There is a decided advantage in point of flavour possessed by the Chinese leaf, though the manipulation appears perfectly equal in both.

A Prize Medal has been awarded to the ANNAM COMPANY for this valuable collection of admirably-prepared teas.

\*These exhibitors' names appear in list of Class IV., which Jury they were also awarded a Prize Medal.

## C. II.—SUBSTITUTES FOR TEA.

Of these the Exhibition contains hardly any examples. One specimen of mate or "Pyaguay tea" (*Ilex Paraguensis*) is exhibited as a curiosity. This beverage is in universal use throughout Brazil, Uruguay, Paraguay, the Plate district, Chili, and Peru.

Dr. GARDNER's prepared coffee-leaves (142, p. 193\*) are worthy of notice, as affording a really palatable drink when infused as tea is; more so perhaps than coffee is to the uninitiated. That this preparation contains a considerable amount of the nutritious principles of coffee is evident from the analysis; but as the leaves can only be collected in a good state, at the expense of the coffee-bush, it is doubtful whether the coffee produced by the berries be not, after all, the cheapest, as it certainly is the best.

## C. III.—COFFEE, COCOA-SEEDS, NIBS, &c.

Under this head the Jury have considered chocolates prepared for use, when plain, or if only sugared, for ordinary use; and have excluded such as are made into pâtes, as more properly belonging to the Confectionery Department.

Many good samples of coffee are exhibited from various parts of the world, and amongst them some of excellent description from British colonies, which have never before been known to produce this article. On the other hand, there is a deficiency of specimens from the most important producing countries, as Jamaica, Dominica, Barbice, St. Domingo, Costa Rica, the Brazils, Manila, and Java.

Of cocoa the same may be said; the best producing countries export the choice of their produce for the markets of Mexico, Spain, France, and Italy; the high differential duty obliging our manufacturers to be contented with the inferior products of Trinidad, Granada, St. Lucia, &c. In chocolates (manufactured cocoa), France alone is well represented; England cannot here compete, for the reason just stated (under cocoa), and various adulterations are hence prevalent, the chief of which are potato-flour and sago.

1. GREAT BRITAIN.—R. SNOWDEN's patent purified coffee-nibs (28, p. 202) are the produce of an improvement in the method of preparing coffee for the table. The berry is split, and the husk (that formerly adhered to the whole berry), which is usually removed from all but the pit, is here extracted from that also: after which operation the berry is better adapted for roasting. The coffee thus prepared is of the finest quality. The illustration of the process is complete, and ample specimens are exhibited. A Prize Medal has been awarded to Mr. SNOWDEN for his new method of separating the tough membrane from the folds of the seed.

J. S. FRY and Sons' case of raw and prepared cocoa and chocolate (31, p. 202) has been awarded a Prize Medal. This series is extensive, and of fine specimens; illustrating fully, by drawings and samples, the preparation of cocoa and chocolate of various kinds; also the plant in its natural state, with its history and manufacture, mode of packing and transport. The cocoa seeds and nibs are exhibited from St. Lucia, Caraccas, Trinidad, New Grenada, Guayaquil, Bahia, Peru, &c.

The chocolate of L. A. MONTEIRO (34, p. 203) has been awarded a Prize Medal for its excellent quality. It is, perhaps, a little over-roasted, if it has a fault.

Honourable Mention has been made of W. A. BENHAM (38, p. 203) for good chocolate. G. B. WHITE (52, p. 203) for the same.

Other chocolates of fair quality are exhibited by the PARIS CHOCOLATE COMPANY (30, p. 202), but the specimens are too sweet. BENJAMIN GRUYS' cocoa (36, p. 203) is fine, but appears rather to be MAGDALENA than CARACCAS, as it professes to be. J. T. BUDD's extract of cocoa (37, p. 203) is apparently damaged by exposure. W. R. LANE's essence of coffee (35, p. 203) is worthy of notice, and has been pronounced equal, if not superior to any similar preparation, though still not so good as coffee prepared by the usual process.

2. EAST INDIES.—The recently extended cultivation of coffee throughout our eastern possessions renders this

department of the Exhibition peculiarly interesting. The samples are, unfortunately, generally insufficient, dirty, and inaccurately labelled.

JAVA exhibits good coffee, but none of marked superiority. Honourable Mention is made of one sample, marked as from the Menado district, which has a good, bold, well-formed berry; and also to some samples from Sonrabaya; both are contributed by the "SINGAPORE COMMITTEE" of the HONOURABLE EAST INDIA COMPANY. The Java coffee is only prized in the market for its delicacy of flavour, as in point of strength it falls short of the West Indian.

The samples of Aden coffee contributed by the HONOURABLE EAST INDIA COMPANY (p. 878) are not superior, and more resemble the Berbera (Abyssinian) plant, usually called long-berried mocha, than the genuine mocha. The specimens are dirty, and not sufficiently garbelled (picked). Aden, alias Mocha coffee, is, along with the other coffees of the Red Sea, sent first to Bombay by Arab ships, where it is "garbelled" previously to its being exported to England. The bean is always broad and small, and the climate of India is supposed to improve its flavour.

The best East India coffees in the Exhibition are those from the Peninsula, the Wynand especially, supposed to have been introduced from Dominica, and originally cultivated on the West Indian principle. Being always got up with great care, it fetches a good price in the market. Of this description of coffee Honourable Mention is made of the two samples from Mysore, both exhibited by Captain MORRIS. The berry is particularly bold and even in both.

Chittagong, and other excellent Bengal coffees, are not exhibited, which is much to be regretted, as the introduction of coffee into the eastern districts was effected many years ago, and is due to the enterprise of Sir W. Jones, since whose time the cultivation has been pursued with great success by private individuals.

BONNEO coffee is exhibited from Mr. McHenry's estate, Sarawak (p. 988), and is awarded a Prize Medal for its great superiority in colour and weight. It is the first sample from that country ever seen by the Jury.

CEYLON.—The great extent and importance of the cultivation of coffee (p. 937) in this island renders this department of the Jury's labours particularly interesting. The samples of both lowland and upland crops are, in general, excellent, and much useful instruction is conveyed by models of the drying-houses, sheds, and implements used in the manufacture of the berry (p. 938); together with the latter, itself, in the different stages of the process of cleaning and drying, removing the pulp and husk, of which a portion, it will be seen, always adheres to the slit, and is ground in the mill, except when removed by Snowden's patent process, already alluded to.

Honourable Mention is made of two samples; one from the Kirklees estate, at 4,500 feet above the sea, which is a good, bold, even, clean, heavy and well-formed berry; the other from the Hunguru estate, 3,000 feet above the sea, which exhibits good pearl-berry, or pearl-berry coffee, a small variety, for which hand-picking is resorted to. Superior samples to any of these are, however, always to be seen in Mincing Lane, and a Prize Medal, therefore, has not been awarded. The native wild or indigenous coffee of Ceylon is also exhibited, which, like the wild plant of Bengal, is of no value.

NORFOLK ISLAND sends an excellent sample of coffee, apparently of the Berbera variety; it is of good colour, well adapted for roasting, and is a most desirable novelty.

ST. HELENA.—There is an excellent sample of coffee from this island, from the private garden of Mr. S. MAGNUS (8, p. 988), of which Honourable Mention is made.

MAURITIUS.—A small sample of inferior cocoa.

AMERICA, once the great coffee country, now cultivates very little indeed. Many samples, of various growths, are sent from the few remaining estates. None are of much merit; the best (that from the estate "Kleis Penderoyen") is good. Pearl-berry coffee is also exhibited, and poor samples of cocoa.

BANABANG sends cocoa of no merit.

TRINIDAD exhibits very poor coffee, apparently degenerated from plants originally of mocha; and from its want of aroma, is probably badly cured or damaged. The cocoa from the same island is truly magnificent, and such as is never seen in our market. Mr. PURDIE, of Her Majesty's Botanic Garden, Trinidad, to whom the public are mainly indebted for the whole Trinidad collection, sends cocoa as prepared for both the English and Spanish (p. 974). With regard to the Spanish, such has never been seen in England; every bean is very large, round, ripe, clean, and of a fine bright-red colour. The English is good of its kind, but is, literally, the refuse of the Spanish; the beans being lean, flat, half-ripe, flinty, and often bitter. A Prize Medal is awarded to the Spanish samples.

WEST AFRICA contributes indifferent coffee.

PORTUGAL sends a very valuable series of coffees from various of her colonies; of ordinary descriptions from ST. THOMAS; tolerably good from the CAPE DE VERDE ISLANDS; bad from TIMOR; worse (but curious from the very small size of the berry) from MOZAMBIQUE; good from ANGOLA; and excellent from MADEIRA.

FRANCE.—There is a very extensive collection of chocolates from this country, and some coffees also. Upwards of fifteen exhibitors contribute largely, and the task of selecting for award has been difficult. Prize Medals have been awarded to four, viz.:—F. A. TURPIN (1046, p. 1228), who exhibits chocolate in every variety of form and flavour, in the highest perfection; E. BERNON (343, p. 1193), for chocolate; DE SANDOVAL and Co. (365, p. 1194) chocolate; WATRELOT-DESPAILL (788, p. 1215), chocolate.

Honourable Mention is made of the following:—C. CHOUQUART (149, p. 1233), for chocolate; MENIER and Co. (925, p. 1224), for chocolate.

Honourable Mention is also made of the Cho'ca, a preparation of coffee and chocolate blended, sufficiently agreeable to the palate, and apparently wholesome and pleasant. The exhibitor is A. E. LEMOLT (303, p. 1191).

SWITZERLAND, SPAIN, PRUSSIA, and the NETHERLANDS, all exhibit fair chocolates. TURKEY sends three samples of the Mocha variety of coffee, not remarkable, and of the usual or Egyptian class of berry.

#### C. IV.—CHICORY AND OTHER SUBSTITUTES FOR COFFEE.

Judging from the number of exhibitors and samples, the cultivation of chicory is far from being extensive or remunerative. Few of the specimens sent are of much value, and none can, under any circumstances, represent coffee in flavour. As an adulteration, the chicory may be profitable, and, supposing this to be its principal use, the exhibition of much was not to be expected.

GREAT BRITAIN exhibits one sample only, and that very good indeed, meriting Honourable Mention. It is from SAUNDERS and GATCHELL, of Dublin (144, p. 193\*).

Honourable Mention is also made of "*Moka en demi-graines*," of J. LEVILLES, Lille (591, p. 1206), an admirably-prepared imitation of coffee, much superior to anything in the Exhibition; and of CATHERINE SOROKIN, Russia, for beautifully cut and peeled dried chicory (69, p. 1368\*).

Besides the above, there are samples from BRENSWICK, PRUSSIA, the NETHERLANDS, and HESSE, none of much importance except the preparations from PRUSSIA.

There is a curious seed exhibited from Turkey called "*Keuguel*," it is said to be extensively cultivated in the Kair-ar-eh and Kouah; and roasted, ground, and used like coffee. The plant is the "*Gungelia*."

#### D. I.—FERMENTED LIQUORS.

The Rules of the Royal Commissioners were opposed to the exhibition of any objects of this class, except such as were remarkable for novelty of invention or production, hence the number exhibited is very limited.

A Sardinian orange wine, "*Vino di Arancio*" (9, p. 1302), is quite a novelty, and apparently a valuable one. This wine is prepared by P. GARASINI, of Genoa, solely from oranges that would otherwise be wasted; it is a remarkably agreeable beverage, strongly resembling fine

Luai in flavour, aroma, and quality. A Prize Medal has been awarded to the manufacturer.

In the Zollverein Department is some well-fermented good beer (15, p. 1046), manufactured for long voyages, by C. CHRISTIAN. This was tasted, and found sound and good but too weak; and being flavoured with absinthium, was unsuited either for the English or Indian markets. Honourable Mention is made of it from its proving, on inquiry, to be highly relished by the beer-drinkers of Germany.

The Austrian "*biere stein*" is a hard, dry, and tough mass, fabricated from an extract of malt and hops only, not unpleasant to the taste, and fairly portable. There are two varieties, a pale and a dark, the latter flavoured probably with liquorice. Beer was prepared from each of these for the Jury, by the Exhibitor, after considerable delay, and though pronounced sound, sparkling, and free from any unpleasant flavour, was thin and not agreeable to the English palate. The preparation had certainly absorbed moisture in the Exhibition Building, which must seriously affect its qualities as a portable article; and the time (about a fortnight), space, and appliances required for preparing beer from it, render it, practically, of little value.

#### D. II.—TOBACCO.

The exhibition of raw and manufactured tobacco is (upon the whole) one of the most satisfactory of the class on which the Jury were called upon to decide. The import trade is very fully represented by numerous samples of excellent articles. The British, German, Algerine, and United States manufactured tobaccos for smoking and chewing are no less complete; and the products of the famous snuff-mills of Scotland, Ireland, Portugal, and Austria are all shown.

1. BRITISH EXHIBITORS.—The beautiful cases of W. BENSON (39, p. 203) have been awarded a Prize Medal; they contain an epitome of the London tobacco trade; and amongst them a box of Havannah cigars, ticketed "Flor de Cabana, Partagas, and Martinez manufacture," stands pre-eminent for evenness and perfection of manufacture. The variously-sized, coloured, and formed cigars in one box are stated to be all the produce of the same crop of tobacco: differences of colour and strength, and, in some degree, of aroma, also, depending upon the age of the leaf employed, and its position on the plant,—the oldest or lowest being used for the well-known (and extensively counterfeited) flat oily cigars called "*Bravas*."

Among other raw or leaf tobaccos, the American varieties are particularly well illustrated, but too insufficiently labelled to convey much information to the public, who would be glad to learn, from such a collection, that the commoner "*slug tobacco*" is prepared chiefly from the "Mason" county leaf; the mild kanaster and similar qualities from the thin, delicately flavoured, mild, Ohio leaf; the common strong-ships' tobacco, extensively used in the royal navy, from the Virginia leaf, &c.

Hungarian tobacco, almost unknown in Great Britain, is also exhibited both in this and in the Russian Department. It is very fine, and of peculiarly delicate flavour, much more so than the tobacco usually cultivated in Turkey.

A Prize Medal has been awarded to E. JONES and Co. (43, p. 203) for their collection of Havannah cigars, illustrating the English market. These are selected from the Exhibitors' stores, and are somewhat unequal in quality, not being picked for exhibiting, nor are they dressed samples.

COHEN and ORR (49, p. 204) have been awarded a Prize Medal for their Havannahs, "*Uguet*" brand; a very good cigar, imported by this firm only.

English-made cigars are copiously exhibited.

E. JONES and BROTHERS (42, p. 203) have been awarded a Prize Medal for their very fine collection of different varieties of cigars manufactured from the Havannah leaf. These are sold at a very cheap rate, are beautifully rolled, draw well, and of fair flavour, the latter being a quality unobtainable in perfection in England.

BARRETT and BUTLER have also received a Prize Medal for their excellent tobacco, cigars, snuffs, and Cavendish

(40, p. 203). The cigars smoke well, with a good white ash, and are of very fair flavour. The cut tobacco and snuffs are of excellent quality. Negro-head and Cavendish are also exhibited, and are successful imitations of the American produce, though inferior in flavour. They are prepared by a peculiar process from the best Virginian leaf. A specimen of English-grown tobacco from the same exhibitor is worthy of notice, as a curiosity: it was raised on a poor light soil in Cambridgeshire, and is an excellent specimen, but deficient in flavour.

RICHARDSON BROTHERS, of Edinburgh (52, p. 204), have been awarded a Prize Medal for their very fine samples of pig-tail and twist tobacco. The leaf is universally used, in this form, in Scotland, both for chewing and smoking; and the exhibiting house supplies the market to a great extent both with this and Scotch snuffs, of which different qualities are exhibited. The specimens of Virginian leaf (intended to illustrate the article in a raw state) are very fine, and in the present state of the market, which is low (owing to bad crops and speculation), would fetch double the average trade price.

A Prize Medal is awarded to the snuff of Messrs. LUNDY FOOT and Co., of Dublin (44, p. 203), an article too well known to require more special notice, and of which the Exhibition samples are admirable.

Honourable Mention is made of the following Exhibitors:—SALES, POLLARD, and Co. (47, p. 203), for beautifully prepared leaves of Cuban (Yara) tobacco of fine quality. BRENNER and TILL, for their samples of leaf tobacco as imported (41, p. 203), including some very rare specimens, seldom or never seen in the market. Amongst these are the Palatinate tobacco (like Benson's Hungarian), Manilla, Perpanibuco, and Yara leaf; also the Havannah leaf, in the flat bundles called "*Minoreas*," in which it is originally put up for export.

M. HYAMS' (p. 203) samples of British-made cigars and cheroots, from the New Granada leaf, deserve notice from their extraordinary cheapness, as does his specimen of Columbian tobacco. The Jury also mention BUCKLAND and TOPPIS (48, p. 203), for their neatly-fabricated cheroots of tobacco and other narcotic herbs and drugs, required as medicine or for luxury. A piece of wood at the mouth extremity retains the oil effectually (an old invention). These cheroots draw well, but are very rank.

THE CAPE OF GOOD HOPE exhibits cigars and kanaster tobacco (36, p. 950), grown in the colony. The defects of the cigars seem to be in the manufacture and choice of leaf, for they are spongy, tough, and leathery, most clumsily made, and smoke with a black ash. The flavour is, however, so far good, as to induce the Jury to encourage improvements in the colony by the award of Honourable Mention to N. MOSS, the exhibitor.

CANADA contributes very fair leaf-tobacco for cigar-making, from J. LEVER (73, p. 963), of which Honourable mention is made: it equals second-class Virginia leaf, and will probably be much improved by care in the culture.

EAST INDIES.—THE HONOURABLE EAST INDIA COMPANY contribute Sourabaya (Java) cheroots, of two qualities: the first, a dark-coloured sample, are very well flavoured, with a fair ash; they burn pretty steadily, and rather strong, and are better than any English-made cigars, but inferior to the Manilla. The lighter-coloured samples are weak and poor.

The Trichinopoly cheroots exhibited (p. 873) are singularly coarse and bad; these, never good in their own country, have possibly been injured on the voyage. Some "*Calcutta Manillas*," as imitation Manillas are generally called, are well rolled, of fine (almond) flavoured tobacco, burn with a white ash, and are equal to second-class Havannahs (p. 873). Honourable Mention is made of them, and of the Chinsurah Havannahs, manufactured probably from "*Sand-head*" tobacco, cultivated on the Arracan coast.

The Jury regret not having found in the East Indian Department, samples of Awallan and various other raw tobaccos, raised in different parts of our Eastern possessions; or of the Lunka cheroots, made from tobacco grown on the banks of the Godavary and Mahanuddy rivers, where its cultivation and manufacture are rapidly

increasing, and the cheroots are superior to any others from that part of the world.

TRINIDAD sends cigars, very clumsily made, and deficient in aroma, but which have been awarded a Prize Medal, for their excellent mild almond flavour, and for the novelty of the manufacture, which is worthy of encouragement (p. 974).

A great deal of tobacco is exhibited from the Northern States of Europe, BELGIUM, the NETHERLANDS, &c.; of the manufactured produce, Honourable Mention is made of the cigars (69, p. 1145) of A. VAN DER LINDEN, of HOLLAND, which are composed, some of Dutch and some of Java tobacco. Also of the cigars of J. P. MULLER (11, p. 1126), of the Grand Duchy of Hesse. PRUSSIA exhibits various samples, generally of common and coarse cigars. Honourable Mention is made of those of A. F. CARSTANZEN SOHN (468, p. 1077), which are better flavoured and more fragrant than any English-made article. AUSTRIA sends many fine snuffs.

The most important exhibition of German tobacco is that from Mannheim, sent by Wm. SACHS, which, unfortunately, owing to the lateness of the crop, arrived too late to be placed on the Award List. It is but fair to the producer to state that it has been pronounced superior in flavour, and in point of curing, to any European tobacco known in the English market. The Agricultural Society of Baden has encouraged the culture of this crop, which has rapidly increased to 200,000 cwt., annually grown on the banks of the Rhine. The cultivation is carried on by small proprietors, and employs 20,000 hands; and the produce is sold at a very cheap rate. It is exported in leaf, in vast quantities, to England, Belgium, Spain, and, in bad seasons, to the Havannah itself; and the cigars are consumed in the United States to a great amount. Great attention is paid to the selection of fine covering leaves, upon the goodness of which the burning and drawing so materially depend; and in this the manufacturers, judging from the samples exhibited, seem to have been eminently successful. Though still inferior to the best American tobacco, it surpasses much that is brought into the market.

The SPANISH Department excels all others in the beauty and variety of its cigars. The Havannahs are here alluded to, for the Manila cheroots are scarcely represented in the Exhibition, which is very much to be regretted.

The best Havannah tobacco farms are confined to a very narrow area on the south-west part of the great island of Cuba. This district, 27 leagues long and only 7 broad, is bounded on the north by mountains, on the south and west by the ocean, whilst eastward, though there is no natural limit, the tobacco sensibly degenerates in quality. A light sandy soil, and rather low situation, suit the best. Of the small collection of cigars shown, two exhibitors have been awarded Prize Medals. The one, DON BUENAVENTURA GONZALEZ ALVAREZ, for his "Ramas" cigars (126, p. 1336); these are considered the best it is possible to produce, and fetch 30l. per 1,000 in the Havannah. They proved extremely fine in flavour, and perfect in burning qualities, but they were so tightly rolled as to draw with difficulty, which is rather considered an advantage by the Spaniards in this cigar. The other Prize Medal was given to a much milder cigar, drawing freely, and considered equally deliciously flavoured, by the Jury. The exhibitor is known as DE CABANAS and CABANEL (126a, p. 1336).

There are also in the Spanish Department a few Manila cheroots; some beautiful samples of the Manila leaf, from the three principal districts of the island, Visayas, Yagorotes, and Cagayan, and some admirable cigarillas.

PORTUGAL exhibits cigars, cigarettes, cut tobaccos, and snuffs; of which the latter are very good, and well cured. There are two qualities of cigars, the one is too mild, but excellent in flavour, and burns well; the other is a compressed darker cigar, resembling the Havannah "Bravas," delicately flavoured and sufficiently strong. A Prize Medal is given for these cigars (1205 & 1207, p. 1318), fabricated at the Royal Tobacco and Snuff Company. There is also a great number of snuffs from the same Company, and from other manufacturers; of the former, Honourable Mention is made of Nos. 1172 & 1183

(p. 1318). The others are, for the most part, too much flavoured with orris-root. The cigarettes are very inferior to the Spanish.

ALGERIA contributes an extensive assortment of tobaccos of many kinds: it is becoming the great tobacco mart of France. Both the Havannah leaf, the Syrian, and the Manila, appear to be cultivated and cured by Arabs as well as colonists: the specimens sent are from exceedingly well-grown, beautiful crops: the curing is perfectly well conducted, and the rolling, &c., of the cigars is sometimes faultless; all are, however, utterly deficient in flavour and strength, being small, poor in quality, and very pale-coloured. The Krachena's cigars are the best, and of the tobacco, a sample from Oran, resembling the Shiraz. Some Philippine Island leaf, exhibited by M. MORIN, of El Biar, is very fine, but in appearance only. There are some cigars made from the imported Havannah leaf, sold at an extraordinarily cheap rate, and cigarillas still cheaper.

A Prize Medal has been awarded to the magnificent TURKISH collection of bazaar tobaccos: it is extensive, and the samples are all particularly fine and abundant. Latakia of the best quality is exhibited here, dark in colour, and of a good tarry flavour. The Moldavian tobacco is also particularly fine. The Jury much regret their inability to give any detailed account of this admirable collection, information being wanted on the subject of the growth of the finer qualities of Oriental tobaccos particularly.

PERSIA is justly renowned for the quality of its tobaccos, both mild and strong: of these, the most celebrated amongst the milder perfumed sorts, is called "Aburika," or "Father of Perfumes;" two samples are exhibited; one, the ordinary dark-coloured, in leaf; the other, loosely twisted into a roll, is paler, more prized in the country, and given as presents amongst the nobles. It is much too mild for appreciation in England, however delicate the flavour. The Damascus tobacco is of the same quality as the celebrated Shiraz, pale-coloured, but rather thick and firm in the leaf, and very strong.

EGYPT sends two bales of "Gerballi tobacco," cultivated, we believe, in the Delta of the Nile, and made into cigars ordinarily used in Egypt; but even there considered very inferior.

RUSSIA. The exhibition is small, but the samples all of good quality, especially the cigarillas of A. SRIOLAZOFF (76, p. 1369), which are as large as ordinary cheroots, and supplied with a short broad reed-tube at the mouth end, a pleasant contrivance. The tobacco used is Russian-grown, very mild, and rather sweet-flavoured, though not equal in aroma to the Havannah cigarillas. A Prize Medal is awarded them. Honourable Mention is made of the Turkish tobacco (75, p. 1369), grown in the Circassian Provinces by MUSTAPHA IDAROF, which is equal to the best grown in Turkey.

UNITED STATES OF AMERICA. The exhibition is chiefly of Cavendish tobaccos, and is both extensive and admirable; the contributions of many makers attesting the importance of the manufacture, and the prevalence of chewing, for which these are principally used in the United States, whilst in England they are most prized as the strongest and best flavoured for smoking. The finest Virginia leaf is used in the manufacture, which consists chiefly in curing and pressing the leaf into flat square cakes of various sizes, a little molasses or sugar being sometimes added. Prize Medals have been awarded to—

DILL and MULCHAHEY (273, p. 1452) for their Cavendish; JAMES H. GRANT (284, p. 1453), Black Cavendish; POITIAUX ROBINSON (265, p. 1452), Cavequish.

Honourable Mention has been made of MOOKLAW and CHILES (8, p. 1433); QYLER and ANDERSON (305, p. 1455); THOMAS and Co. (268, p. 1452), for Cavendish; JAMES THOMAS (528, p. 1467), for Negro-head. Also of the Maryland leaf tobacco and cigars, exhibited by the MARYLAND COMMITTEE (included in Prize Medal awarded by Jury of Class IV.).

E.—SPICES AND CONDIMENTS, VINEGAR AND PICKLES, CINNABON, CASSIA, &c.—This product is at present confined to the Continent and Archipelago of India,

whence various samples are sent; none, however, equaling that from Ceylon, for which a Prize Medal is awarded to the Exhibitors, Messrs. ALBRECHT, GREENHILL, and Co. (p. 937). The EAST INDIA COMPANY also exhibits Ceylon cinnamon, and various allied products from Assam, and the peninsula of India, such as many varieties of cassia bark and leaves. Some of the cinnamons, or rather cassias, from the north-east frontier of Bengal are of a particularly fine quality, and are sold abundantly in the Calcutta market as Ceylon produce. Great boxes from the Khassya hills, especially, have been sent home to Europe, covered with a thin layer of the Ceylon article. Malacca and Java both exhibit inferior cinnamon. In the Chinese Department, is a sample of the famous cassia of that country, exhibited by Mr. KEEVER, whose perfume and flavour are incomparably superior to those of any spice of its class. Its native place is unknown, though supposed to be the interior provinces of China. The market price is said to be 5*l.* per lb.

**NUTMEGS, &c.**—There are two general collections of spices, which have been awarded Prize Medals. Messrs. TRAVERS' (53, p. 204), which illustrates the London spice trade, and that of Oriental spices, from the East India Company. Travers' collection is particularly fine, the specimens admirable, and in beautiful order. The Indian Collection, again, is far more extensive, but, as a whole, inferior in quality: it includes 12 bottles of nutmegs from various quarters, 5 of maces, 4 of gingers; cloves from Malacca, Timuvelly, and Madras; 6 bottles of capsicum, besides turmeric, &c. The Malaccas, Borneo, Ceylon, and New Granada, all exhibit nutmegs: those from the latter country are particularly splendid, and as the product is almost unknown, and the culture deserving of great encouragement in the West Indies, a Prize Medal is awarded to H. GROSE (1, p. 976), the Exhibitor.

TRINIDAD exhibits a fine collection of both East and West Indian spices, many of them cultivated in the Royal Botanic Garden of that island, by Mr. PRIDE, to whom a Prize Medal is awarded for excellent nutmegs, fine cloves, mace, ginger, black, white, and Cayenne pepper, turmeric and vanilla.

MESSRS. HAMMOND'S collection (2, p. 988) of Eastern Archipelago spices deserves Honourable Mention: the cloves are of the very finest description, and the nutmegs, mace, ginger, and peppers are all good.

**PEPPER, GINGER, &c.**—These articles are more or less abundantly exhibited in the collection of spices mentioned above, whilst other exhibitors have confined themselves exclusively to these products. NORFOLK ISLAND exhibits a box of Cayenne pepper (27, p. 993), shown by Sir W. T. DENISON, of very superior quality, which has been awarded a Prize Medal. FORTNUM and MASON'S ginger in the case of dried fruits, for which a Prize Medal is given, is unrivalled. PAYNE and SON'S spices (22), especially pickles and curry-powders, are very good, and Honourable Mention is made of them. Ginger, cardamoms, and turmeric are chiefly exhibited from Ceylon. Black, white, and capsicum pepper, of innumerable varieties, from Borneo, Penang, and West Africa; and, in the New World, from the United States, Demerara, Trinidad, and Barbadoes. The now little-known Guinea pepper is exhibited, from Demerara and West Africa, its native country. Vanilla is found in Fortnum and Mason's case, in the Trinidad Collection, and amongst Fry's series of articles used in the manufacture of cocoa, chocolate, &c.

PORTUGAL sends capers of a fine description. EGYPT and TURKEY exhibit large collections of aromatic seeds, used as condiments; such as anise, cummin, fennel, cardamoms, &c.

MUSTARDS are exhibited abundantly from FRANCE, the celebrated "Moutarde de Maille" being, perhaps, the finest in the Exhibition. T. DEWAR'S preparations of mustard (116, p. 207) have received Honourable Mention. In the United States this plant seems to be very extensively cultivated, and the specimens are good from BURROWS, M. A. MISTEN, and T. ANNIGHTLE, of Kentucky;

\* This exhibitor has been awarded a Prize Medal by the Jury of Class IV, in whose list his name appears.

and J. D. McCULLAGH, of Kentucky, sends samples of wonderful pungency. The Spanish mustards of SANTA-RELLA, and the RUSSIAN are also excellent. Mustard-seed is exhibited from the CAPE OF GOOD HOPE, EGYPT, INDIA, PORTUGAL, and SPAIN, where, as also in India, it is cultivated more for the oil contained in the seeds than for any other purpose.

VINEGARS are scantily exhibited: some of the malt vinegars of HILLS and UNDERWOOD (7, p. 801) are particularly delicate, and a Prize Medal is awarded for the collection. The wood-vinegar of GILLESPIE and Co., of Canada (133, p. 986), is worthy of Honourable Mention, as is the raspberry-vinegar and capillaire of J. FLETCHER (127, p. 986), of Canada. A Prize Medal has been awarded to the admirable French aromatized wine-vinegar of MAILLE and SENOUP (1839, p. 1240); and Honourable Mention has been made of that of two other exhibitors in the French Department, COCOTIN RAOULT (1570, p. 1252), and RIGAUDIT, JUN. (1686, p. 1257). For pickles, a Prize Medal is awarded to the splendid collection of BATTY and FEAST (116, p. 207). The Van Diemen's Land pickles and sauces are worthy of notice.

#### F.—STARCHES.

The various flours having been reported under A. 6, starches for manufacturing purposes being excluded from this class altogether, and there being no lichen food exhibited, there remains nothing to be considered under this head, but a few miscellaneous fecule, farine used in tropical countries, or produced there for export; as sago, arrowroot, tapioca, &c.

ARROWROOT is largely exhibited, especially from our tropical colonies. That from the HERMUDAS, imported by B. C. T. GRAY and SON, is admirable, and worthy of Honourable Mention; as is a Montserrat sample. This substance is also shown among the products of GUERNSEY, DEMERARA, TRINIDAD, SINGAPORE, JAVA, BORNEO, CEYLON, and NORFOLK ISLAND; that from the last-mentioned place being of a superior description. From Canada a sample was exhibited by R. BUCK, which received Honourable Mention.

PLANTAIN MEAL, prepared from bananas, sliced, dried, ground, and washed, has lately attracted some notice in England: samples are exhibited both from DEMERARA and MADRAS. Honourable Mention is made of the DEMERARA samples exhibited by W. DAVISON (12, p. 978). TOUS LES MOIS flour, of excellent quality, from the root of Canna, is sent by M. CHAPPEL from Algeria (16, p. 1260), of which Honourable Mention is made. Specimens of the same articles are also sent from BARBADOES.

CASSAVA MEAL and BREAD, prepared from the roots of two species of euphorbiaceous plants are exhibited from DEMERARA; the bitter cassava, from *Janipha manihot*, and the sweet from *Jatropha Loefflingii*. MANTOCA flour (also from *Jatropha manihot*), a very similar substance, is exhibited from TRINIDAD, CEYLON, and ANGOLA, which last also sends tapioca, sago, coarse and fine, with a specimen of the palm-tree: pearl sago, and sago flour, are sent from the Eastern Archipelago and Borneo, also from Ceylon. Sago cake is exhibited from the Moluccas. Honourable Mention is made of the pearl sago exhibited by the Singapore Committee of the Honourable East India Company, imported from Borneo and Sumatra.

There are two remarkable and closely-allied substances, brought together from countries almost at the antipodes of one another, and both new to the Jurors; the one is a starch washed from a species of *Zamia*, found wild in ST. DOMINGO, and exhibited by Sir R. SCHOMBURGK (p. 1429): the taste is odd and salt, as if it had been immersed in lime; in its present condition it can be regarded as a curiosity only. The other is a starch from a West Australian *Zamia*; this would appear, in quality, to rival arrowroot, which, in every respect of feel and taste, it resembles.

Various other small samples of *fecula* are scattered through the Exhibition, but do not appear important.

#### G.—SUGAR.

A very limited number of samples of this article are exhibited, and the deficiency is most marked in the south.

tributions from the principal sugar-growing countries. For instance, Jamaica, Tobago, St. Vincent, and every other West Indian colony, except Trinidad, Demerara, and Barbadoes, have failed to send specimens. There are none from the foreign possessions in the Old World, Porto Rico, the Brasile, or Havannah, none from Manila and China, whilst Java and Madras send little more than one sample each.

In refined sugar the British manufactories are wholly unrepresented.

A specimen of sugar, from cane grown in England, deserves notice as a curiosity. The sample was made without filtration, by Dr. EVANS, from cane grown by H. PERKINS, Esq., in Surrey.

**EAST INDIA POSSESSIONS.**—A sample of Ganjam (Madras Pres.) (pp. 875, 876) sugar in the Honourable East India Company's contribution has been awarded a Prize Medal: it is exhibited by Mr. O. P. ONSLOW, Aska Sugar Factory. The colour and grain leave nothing to be desired. There are two specimens of Rohilcund sugar from CAREW and Co.'s manufactory at Shah-jehanpore; of which one, said to be manufactured by a European process, is excellent, and worthy of Honourable Mention; that prepared by the native process is very inferior. Various kinds of a good description are exhibited by the ASTAGRAM SUGAR COMPANY, to whom a Prize Medal has been awarded. Sundry raw sugars are exhibited from the Decan, apparently manufactured on the Mauritius principle; they are good, and well crystallized, but are not remarkable. One sample has received Honourable Mention: it is a white refined sugar, in the form of bricks, not clean, but apparently a good useful article. It is possibly a date-palm sugar.

JAVA exhibits two fair samples from Sourabaya, to which a Prize Medal has been awarded: both are clayed sugars: one is said to be manufactured on a new (undescribed) plan, the other by the low-pressure vacuum-pan process; both are superior to the ordinary Dutch sugars. A Prize Medal is given to the MAURITIUS sugar (3, p. 956), from the Phoenix estate of WILKS BROTHERS and Co.: it is a splendid sample, dry, well crystallized, produced by the vacuum-pan by a single process; but adulterated and free from colouring matter. A sample adjudged to the very fine Siam sugar of W. P. HAMMOND and Co.

**DEMERARA.**—A Prize Medal is awarded to the fine, well-crystallized sample produced by the vacuum-pan, and exhibited by G. ANDERSON and Co. (36, p. 979). TRINIDAD sends good samples: one is curious, from its being purified with animal charcoal. BARBADOES exhibits fair specimens.

**FRANCE.**—The collection of beet-root sugars, especially the refined, is very good from this country, and presents much both of novelty and interest. Two of them demand particular notice; they are the produce of MM. NUMA GRAR and Co. and MM. SERRET HAMOIR and Co., for both of which Council Medals have been awarded.

MM. SERRET HAMOIR and Co. are awarded the Council Medal for beet-root sugar (1485, p. 1247); the processes employed in their manufactory having enabled them to sell the sugar at a lower price than any other article of the same quality, and not being open to practical objection. The principle of MM. SERRET HAMOIR and Co.'s success is the use made of the refuse molasses, from which potash and alcohol are procured in sufficient abundance, and of such a quality as to be very remunerative.

M. NUMA GRAR receives the Council Medal for sugar (667, p. 1211) obtained from beet-root by the barytic process. It is stated to be applicable to the refuse molasses of any manufactory, precipitated with barytes, and afterwards wholly freed from this poisonous ingredient. The molasses thus treated yields a large percentage of sugar.

Three Prize Medals have been awarded to Exhibitors of refined beet-root sugar, viz.:

"T. CRESPER-DILLON, of Arras (465, p. 200), for excellent beet-root sugar, prepared by the ordinary method.

JEAN-PIERRE PREVOST and Co. (1277, p. 1328), for sugar prepared in moulds by stamping.

ROUSSEAU BROTHERS (1457, p. 1245), for several samples prepared "sans raffinage."

SPAIN exhibits a few good sugars of native and colonial growth, for which three Prize Medals are awarded: to J. N. ENRIQUEZ (176, pp. 339, 340), for refined sugar made from Malaga-grown cane; to J. J. DE ARRIETA, (295, p. 1347), for various samples of Havannah-grown sugar, refined on the estate itself; and to J. De ZULUETA (179A, p. 1340), also for excellent Havannah sugar.

AUSTRIA contributes good beet-root sugars. A Prize Medal is awarded to ANTON RICHTER and Co. (57, p. 1008), for five tips (or noses) of double-refined beet-root sugar in small leaves, beautiful in quality and colour; also for good sugar-candy. Honourable Mention is made of the Moravian beet-root sugar of the Brothers Chevaliers de NEUWALL (56, p. 1009), and ROBERT and Co. (55, p. 1009). Also of the Prince FERDINAND von LONKOWITZ, Bohemia (58, p. 1009), and of the sugar manufactory at TUMACZ, in Galicia (60, p. 1070).

BELOIUM exhibits in every respect the finest sugar-candy (81, p. 1151) which has ever been seen by the Jurors. A Prize Medal is awarded for it to Messrs. CLAUSS and CARBON, of Gand (81, p. 1154), who exhibit also a fine series of coloured and other sugars. These are probably all cane produce, judging by their appearance, weight, and hardness.

RUSSIA and PRUSSIA exhibit a few sugars, but none of any great merit, except the beet-root sugar of HINSHMANN, HINSHELDORF, and RAVITSCH (79, p. 1369), and that of BREITHE and Co. (687, p. 1088), of both of which Honourable Mention is made.

UNITED STATES.—A good sample of cane Muscovado (397, p. 1462) is exhibited by M. WHITE, of New Orleans, for which Honourable Mention was awarded.

**MAPLE SUGAR.**—This substance, which is abundantly used in America for common purposes, has hardly had a fair trial in England, owing to the cheapness of the colonial cane sugars, and the difficulty of depriving the maple produce of its peculiar flavour. If it promised success, the cultivation of the sugar-maple tree might be almost indefinitely extended in Canada over a large area, well suited to this tree, but unfit for pasture and agriculture. There are few samples exhibited, but to three of them Prize Medals are awarded; two—in the United States,—to W. BARNES (246, p. 1452) and L. DEAN (245, p. 1452); the other to A. FISHER, of Canada (69, p. 963), for the sample of double-refined sugar, which is of superior colour and grain. Honourable Mention is also made of that from J. BALES, of Canada (67, p. 963).

**PALM SUGARS.**—These are exhibited chiefly as curiosities, and consist of Gomuti-palm sugar (*Arenga saccharifera*) from Java: date-palm sugar from the Decan; Nipa sugar (from stems of *Nipa fruticans*), probably from the Sunderbunds, exhibited by the HONOURABLE EAST INDIA COMPANY; (pp. 875, 876), and sugar from the fleshy flower of *Bussia latifolia*, an East Indian tree, from whose fleshy flowers, after fermentation, an ardent spirit is distilled.

**GRAPE SUGAR** is exhibited of fair quality from Tunis and from the Zollverein States; also, as molasses, from Spain.

**LIQUORIC.**—Nothing of any importance is contributed of this description. The Spanish is almost the only sample: it is very good.

## ANIMAL KINGDOM.

### II. I.—PRESERVED ALIMENTARY SUBSTANCES.

It is impossible to over-estimate the importance of these preparations. The invention of the process by which animal and vegetable food are preserved in a fresh and sweet state for an indefinite period has only been applied practically during the last twenty-five years, and is intimately connected with the annals of Arctic discovery. The active measures taken to discover a north-west passage, and to prosecute scientific research in all but inaccessible regions, first created a demand for this form of food; and the Admiralty stimulated the manufacturers to great perfection in the art. As soon as the value of these preparations became generally admitted in

cold climates, their use was extended to hot ones, and for the sick on board ship under all circumstances. Hitherto they had only been employed as a substitute for salt beef or pork at sea, and, if eaten ashore, it was, at first, as a curiosity merely. Their use in hot climates, however, speedily became evident, especially in India, where European families are scattered, and where, consequently, on the slaughter of a large animal, more is wasted than can be consumed by a family of the ordinary number. The consumption of preserved meats became, at once, enormous: hundreds of tons are annually transported to the East Indies and all our colonial possessions, and many are consumed by our fleets.

The cheapness of these preparations is most remarkable. This arises from the processes and materials for the cases being inexpensive, and from there being no waste of the meat: all that is good goes into the case, which is always filled. It is affirmed by the manufacturers and others, and probably with truth, that meat in this form supplies troops, and the fleet, with a cheaper animal diet than salt provisions, from avoiding the expense of casks, leakage, brine, bone, shrinking, stowage, &c., which are all heavy items, and entail great waste and expenditure: added to this, the damage of one cask of salt meat risks the loss of all its contents: whilst the meat canisters are, comparatively speaking, imperishable, and an accident to one occasions a loss of at most but from 2 lbs. to 4 lbs. of food.

Several hundred canisters of meat are exhibited from various countries, and in some of these by many different persons. Their merits were tested by a selection from each: the cases were opened in the presence of the Jury, and tasted by themselves; and, where advisable, by associates. The majority are of English manufacture, especially the more substantial viands; France and Germany exhibiting chiefly made dishes, game, and delicacies—of meat, fish, soups, and vegetables.

The Jury desire to draw attention to the fact of viands of this description being extensively prepared in Australia, Tasmania, the Cape of Good Hope, Canada, &c., of equally good description with the English. Animal food is most abundant and cheap in some of those colonies. In Australia, especially, during seasons of drought, it is wasted in extraordinary quantities: flocks are slaughtered for the tallow alone, and herds for their bones and hides. Were the meat on these occasions preserved, it cannot be doubted that it could be imported into England, and sold at a cheaper rate than fresh meat in our metropolitan markets, to the great benefit of the lower classes.

Among all the preparations exhibited by France, England, &c., there is no perceptible difference either in the mode or perfection of preservation. To seal, hermetically, full tin canisters is the general principle adopted; and it is effected by plunging them in boiling water, and soldering a small orifice left purposely, by which all the air is expelled; this principle, variously modified, being the same throughout.

The contents of all the cases, of whatever kind, have lost much of the freshness in taste and flavour peculiar to newly-killed meat: they are always soft, and, as it were, overdone: the nutritious principles are, however, perfectly preserved. As nutriment they are unexceptionable: they are wholesome and agreeable, and often pleasantly flavoured. Vouchers are given for some of the samples tasted by the Jurors having been preserved for twenty-five years and upwards: these are in a perfectly sound state, and did not perceptibly differ from the contents of canisters only a few months old. So long as the sealing remains sound, the viands appear to undergo no change. Any difference between the contents of the properly-prepared cases is to be attributed to the state of the food before preparation, or to the cooking, and not to the method employed for preserving, which is simple and universally applicable.

Vegetables preserved in a similar manner, have been considered by the Jury with the animal food. Generally speaking, their flavour is fresher than that of the meats, especially in the case of those abounding in saccharine principle, as beet, carrots, parsneps, salsify, which pre-

serve to advantage. The more farinaceous do not preserve so well, such as green peas, &c.; whilst those abounding in volatile oils are hardly worth preservation at all (especially cabbages, turnips, and celery), except as anti-scorbutics.

M. E. MASSON'S dried compressed vegetables (1848, p. 1246) demand especial notice, as showing one of the most remarkable discoveries of modern times in this branch of manufacture: they have been awarded a Council Medal. By M. Masson's process, the most bulky, soft, and succulent vegetables are reduced to a fraction of their volume, and are preserved in a dry, indestructible state. After boiling for a rather longer time than usual, they are restored to something of their original form and consistence, retaining all their nutritious principles, and much of their flavour. Chollet and Co., the manufacturers of these preserved vegetables, use only dedication and compression in the process, which is Masson's invention. According to a statement published in the "Comptes Rendus," as read before the Paris Academy, the vegetables are reduced seven-eighths in weight, and proportionally in bulk. They require to be boiled for one hour and a-half to one hour and three-quarters, and on cooling, are found to have regained nearly all their evaporated juices.

If, as the Jurors have reason to believe, these preparations retain their good qualities for several years, they cannot be too strongly recommended to public attention. It would probably be necessary for long voyages that these square cakes be packed in perfectly dry casks or tanks, as biscuits are.

In the British Department, J. H. GAMBLE (12, p. 201) and RITCHIE and McCALL (15, p. 202) exhibit very fine samples of preserved viands and vegetables, and to each a Prize Medal is awarded for excellence of material and preservation. Ritchie and McCall's articles deserve especial notice for the great size of the pieces of meat, combined with all the firmness of texture that is attainable. All are said to be prepared by Goldner's process, the results of which are equal, but not superior, to the ordinary process, as far as the Jury could decide, after a very protracted examination and comparison.

COPLAND, BARNES, and Co. (11, p. 201) exhibit few meats, but abundance of fish, ham, and vegetables, dressed in various ways. A Prize Medal has been awarded for these in conjunction with the admirable tart-fruits referred to elsewhere.

A preserved pig, entire (14, p. 202), a conspicuous feature in the English Department, deserves notice as a remarkably successful instance of curing on a large scale.

J. and J. P. LEONARD'S fresh meats (26, p. 206), prepared on Toplin's principle, are not so successful a sample of preserved animal food as would be imagined from their appearance of freshness and goodness. WHITNEY'S fresh beef (grated?) (26, p. 202) looks sound, but is not exhibited in sufficient abundance, and particulars of trial are wanting.

MADAME D. ST. ETIENNE exhibits specimens of vegetable substances, meat flours, &c., prepared for long voyages; also a bottle of dried and pulverised spinach (138, p. 208), of which Honourable Mention is made. It is a curious preparation, resembling M. Masson's; but the quantity exhibited is too small, and the general applicability of the process is not known.

CANADA demands very prominent mention for the abundance and excellence of the preserved viands exhibited; but all are of the ordinary description of cured meats, and none have any peculiar merit or novelty to entitle them to reward, except the hams of G. REINHARDT, of Montreal, which have been awarded a Prize Medal. There are barrels of beef, pork, and tongues, cases of smoked hams, bacons, and sausages, kegs of lard, &c., all produced at a remarkably cheap rate.

NEW BRUNSWICK and NOVA SCOTIA contribute excellent fresh salmon, preserved in tin canisters, and quite equal to the English. Honourable Mention is made of that of T. HOLLIDAY, of Halifax, and W. J. FRASER, of Miramichi (24, p. 269).

AUSTRALIA.—H. E. & M. MOSEY (101) are exhibitors of excellent preserved fresh meats, in all respects equal

to the English, but exhibited in small quantity and in no variety. Honourable Mention is made of them. The NEWCASTLE (N.S.W.) PRESERVING COMPANY (7, p. 989) contributes admirable boiled mutton in tin cases, whose especial goodness is evidently owing to the excellence of the material, for the process is the ordinary one, and its peculiarities are the same as the English. A Prize Medal has been awarded the Company. Some excellent spiced beef hams were exhibited by J. BRICKERS (2A, p. 989), which have received Honourable Mention.

VAN DIEMEN'S LAND sends excellent hams, prepared by MARSHALL, of Hobarton, and exhibited by F. LIPSCOMBE (297, p. 992), of which Honourable Mention is made. Also good preserved meats prepared by AUCOCK, of Hobarton (p. 992).

NEW ZEALAND.—Some dried mullets are exhibited from this colony, cured for the China market, which appear sound; but not high flavoured.

The CAPE OF GOOD HOPE sends casks of salt beef and pork, both of good description.

FRANCE.—The collection of hermetically-sealed meats is very extensive and good, but differing from the English in the same degree as a French table differs from an English one, namely, in the smaller quantities preserved, in their being generally made-dishes, and in a greater proportion being objects rather of luxury than of common use. A Prize Medal has been awarded to GUTHRIE, DES LANDELLES, & Co. (1262, p. 1237), for a very fine series of preserved meats and vegetables, and to CHUWET, junr. (121, p. 1177), for preserved meats and vegetables, especially truffles. Of the latter there are many exhibitors in the French Department, and all are good. Honourable Mention is made of the "mouton rôti," and sardines in oil, of J. PENEAUX (970, p. 1225), also of the preserved game of GREMALLY (246, p. 1188).

For vegetables in particular, Honourable Mention is made of the preserved green peas of F. ROCHER & SON (994, p. 1226), and of the salsify of RÖDEL & SON\* (992, p. 1226), which were the two best amongst many samples of all kinds of preserved vegetables exhibited by them in this department.

Fish are abundantly exhibited, and the Jury have made Honourable Mention of the sardines in oil of A. GILLET (526, p. 1204), PELLIER BROTHERS (948, p. 1218), and M. CAME'S (789).

AUSTRIA is almost the only other contributor of fresh meats preserved by hermetically sealing. Honourable Mention is made of the preserved larks of C. WEILL (25).

SPAIN sends a good supply of beef, pork, bacon, and hams, all of excellent quality. The hams are particularly good, especially the Montanichis hams (1399, p. 1337), to which a Prize Medal is awarded: it is exhibited by, and sent from, the BOROTCHI OF AVILES. There is also some good Spanish salt butter.

LUBECK contributes a selection of hermetically-sealed provisions in tin cases, all very good. A Prize Medal is awarded to the exhibitor, D. H. CARSTENS (2, p. 1140).

SWITZERLAND.—Some fish and meats dried and preserved in a fresh state by simple desiccation, are very remarkable. They are exhibited by H. BATT (52, p. 1269, 1270), to whom a Prize Medal is awarded. They want flavour, and are discoloured, but both the muscle and fat of the meat are perfectly sweet and fresh. Simplicity and cheapness of preservation are the great recommendations of these articles, to which may be added the absence of any foreign matter. They will apparently keep well, but they want testing by exposure to a damp tropical climate, and by confinement in bulk.

RUSSIA exhibits dried fish, apparently in exceedingly good order.

UNITED STATES.—The hams are of a very superior description indeed, and have been pronounced by competent judges to be unsurpassable. Prize Medals have been awarded to two contributors of this article, CHARLES DUFFIELD, of Louisville (368, p. 1459), and SCIBOLKY and HUGH, of Cincinnati (200, p. 1449). The lard is

exceedingly fine, and Honourable Mention is made of that of G. DOMINIC (21, p. 1434), also by Jury of Class IV.

## II. II.—PORTABLE SOUPS, CONCENTRATED MEATS, &c.

A more simple, economical, and efficient form of portable concentrated food than the American meat biscuit of GAIL BORDEN (524, p. 1467) has never been brought before the public. The inventor combines the best wheat flour with the nutriment of the finest beef, and presents them for use as food in the form of a dry, inodorous, flat brittle cake, which will keep, when dry, for an unlimited period. It only requires hot water and seasoning to the taste to produce a first-rate agreeably-flavoured, highly-nutritious soup, somewhat of the consistence of sago. One pound of the biscuit contains the nutritive matter (fat excepted) of five pounds of prime beef, mixed with half a pound of the best wheat flour. One ounce of the biscuit grated, and boiled in a pint of water, forms a rich nutritious soup. It is averred by the inventor, and he is supported by authority satisfactory to the Jury, that 10 pounds of this substance, with a proper allowance of water, afford, both in bulk and nutriment, food sufficient to support the physical and mental powers of a healthy working man for a month. The Jury further believe it to be as portable and unchangeable as the inventor declares.

Chemical analysis shows the proportion of meat to starch to vary in different samples, but that in all cases the meat is perfectly sound and free from putridity, and the starch unaltered. On an average it contains 4.7 per cent. of nitrogen, or 31.85 per cent. of flesh-forming principles. A Council Medal is awarded to this excellent preparation of Mr. GAIL BORDEN.

The osmazone of G. WARRISLER (Cl. III., 21, p. 202) is the nutritious matter or juice of meat which is set free during the operation of boiling down fat for tallow in Australia. This is afterwards concentrated and preserved in the form of sausages. A great amount of nutriment is thus obtained in a portable form, and when boiled with gelatine, it forms a palatable diet. The price is very moderate, 1s. per lb., and it hence commands a market, and is much used to form a gravy to meat. The exhibitors declare that one pound weight is the equivalent of the nutriment of 30 lbs. of fibrine, which argues a high economic value. Chemical examination gives 2.1 per cent. of nitrogen, or 15.65 per cent. of flesh-forming principle. Honourable Mention was awarded.

DR LISCOTT & Co.'s "biscuit beef," in the French Department 1328, pp. 1259, 1340, in form resembles ordinary coarse-ship-biscuit, of a large size, and has an animal, salt, and not very agreeable taste. It is exhibited in two forms, the ordinary biscuit above mentioned, and another marked P., which is to be ground up and boiled, 30 or 40 minutes, as soup. 600 grammes (equal to 1.322 lbs. avoird.) are stated to be the equivalent of a soldier's complete daily rations.

PRESERVED MILKS. Several specimens of these valuable preserves, possessing various degrees of merit, have been submitted to the attention of the Jury. Of these the "Concentrated Preserved Milk" of E. D. MOORE (139, p. 193\*) has received a Prize Medal. It contains all the nutritious qualities and much of the flavour of fresh milk. J. H. GABLE (12, p. 201), and RITCHIE and MCCALL (15, p. 202), both exhibit preserved milks in hermetically-sealed cases, but the samples from each vary considerably in quality.

Honourable Mention is made of MARTIN DE LIGNAC'S consolidated milk, France (942, p. 1224). That of V. B. FADEGINNE (Cl. III., 140, p. 193\*) is also worthy of notice as a curious preparation; but it appears to attract moisture, and has a decided flavour of cheese. The preparation of OUDIN & Co., of Paris (1375, p. 1242), and the Lubeck preserved milk (2, p. 1140), are too much sugared.

## II. III. and IV.—CAVIARE, TREPANG, &c. SWALLOW'S NESTS, &c.

Russian caviare of the very finest quality is exhibited by NIKITA VSEVOLODOWITCH VSILOWSKY (338, p. 138\*). It receives Honourable Mention.

\* These exhibitors were awarded a Prize Medal by the Jury of Class XXIX., in whose list their names appear.

Borneo and Singapore both supply trepang (bêche de mer, or sea-slug), in considerable abundance; and magnificent specimens are exhibited in the Chinese Department by H. HAMILTON LINDSAY (11, p. 1422).

Swallows' nests, used extensively for soup by the Chinese and natives of the Eastern Archipelago, are exhibited of very high quality, by H. H. LINDSAY (11, p. 1422), in the Chinese Department, together with an excellent model of the mode of attachment to the sea-cliffs, adopted by the birds for their nests. The material used is believed to be a sea-wood, resembling in form and substance the Carrageen moss of the Irish seas, which becomes glutinous when thrown up on the beach and decomposing; a peculiar fluid secreted by the swallow aids in the process of constructing the nest. Borneo and Ceylon supply inferior nests, and Java some of good quality.

Malacca, Singapore, and Macassar, all send agar-agar, a very similar natural production to that from which the swallows' nests are formed, and employed for the same purposes.

New Zealand, Manilla, and Malacca send sharks' fins, which are another favourite article of food with the Chinese.

#### H. V.—HONEY.

There is a considerable variety of specimens of honey, both in the comb and run; also of hives, simple and complicated, for practical or scientific purposes, but no novelty of importance. Among 38 hives exhibited, none present any practical improvement. Only one, which dates upwards of two centuries ago, is really adapted to the requirements of the bees. To this the depriving system (which deprives the bees of a portion of their honey, without destroying them) was added; century later, much ingenuity has since been expended, chiefly in complicating hives with various contrivances for ventilation, &c., in no instance producing a return correspondent to the increased expenditure, the chief result being hindrance to the extension of bee culture.

**ITALY.** Among many hives, and exhibitors, one alone has been selected as worthy of a Prize Medal: viz. J. MILROSE (Cl. IX., 291, p. 402), who sends an improved cottage hive, with single glass and cover. Simplicity and adaptation to practical purposes are here the objects aimed at: the hive is cheap and available for all classes. Mr. MILROSE also exhibits bees well managed and working profitably in a "mansion of industry," a leaf-hive, on Huber's plan, for scientific investigation:—of merit, for its correct proportion and adaptation to the purposes required; also beautiful honey.

Of the various samples of honeycomb, that of W. C. KITCHENER, Newmarket (Cl. III., 5, p. 201), has been selected as of great superiority, that in the upright glass being perfect in every point. The glass of honey in comb, exhibited by Miss MORRLOCK, is of equal beauty. Both have been rewarded with Honourable Mention. FORTNEY and MARON's exhibition of various honeys (55, p. 204) is good and curious, and well worthy of attention: it is the result of much pains to illustrate this branch of trade.

2. CANADA (131, p. 966) exhibits honey, but coarse, and of dark colour.

3. BRITISH GUIANA.—The produce of a native bee, said to be of easy domestication, is exhibited from Woodland's Plantation (Mahaica River) (124, p. 986). Its qualities appear remarkably good, particularly as to flavour and sweetness, but it has undergone fermentation. The honey is the produce of a stingless bee; it is deposited in pouches, from which it is extracted by puncture, after which the bee stops up the orifice and refills the pouch.

4. The CAPE OF GOOD HOPE sends excellent honey (52, p. 952), fit for the English market, firm, finely granulated, rather opaque, but of good pale-yellow colour, and delicate flavour. Honourable Mention was made of the exhibitor, J. G. JOUBERT.

5. SOUTH AFRICA produces excellent honey; and several samples were forwarded to the Exhibition, but the jars arrived in a broken state.

6. FRANCE.—M. Chevalier DE BEAUFORTS (47, p. 1173), exhibits a large series of bee-hives and apiarian apparatus, all manufactured for practical purposes. The workman-

ship, generally good, is in parts unequal. Some of the appliances are better suited to the climate of France than of England. A Prize Medal is awarded for the hive on Huber's plan, well adapted to the climate of France. The same exhibitor sends various honeys and straining apparatus.

The artificial honeycomb of M. DAMAINVILLE, of Cressy (153, p. 1178), is a clever and apparently new contrivance, well adapted to the breeding of bees, though perhaps it would be better so if the cells were less deep. It has been rewarded with a Prize Medal.

Honourable Mention is made of a coopered cask of run honey, of the finest quality as to granulation, consistency, delicate colour, and fine flavour. It is properly exhibited in bulk (1558, p. 1251), sent by CHAILLOUX LAPAGE and PORENON.

An equally fine and perhaps higher-flavoured honey, from the Basses Alpes, is exhibited by M. LAUGIER (1640, p. 1255).

7. SPAIN. Much of the honey from this country is admirable; but it is to be regretted that all the samples in the Catalogue are not forthcoming, particularly the Hinojos honey, said to be the chief product of the district. The El Moral virgin-honey (180, p. 1340), exhibited by A. MOLINA, is excellent, of good colour and granulation, delicate and highly flavoured, and of remarkable sweetness in after-taste. It is rewarded with Honourable Mention.

Many of the orange-flower honeys are good, especially those of Guadalupe, the great orange-flower honey producing district of Spain; but all are injured by transference to stoppered bottles.

8. PORTUGAL. All the honeys, six samples, are deteriorated by being put in stoppered bottles. Honourable Mention is made of No. 593 (p. 1314), from J. B. DU MATOS.

9. SARDINIA sends two samples of honey, one sweet, and one bitter.

10. SWITZERLAND contributes a beehive, neat, strong, and larger than those of English make. It is on the depriving system, consisting of a conical stock-hive, with a cap, and is exhibited by L. DISTRAZ (71, p. 1271), of whose invention Honourable Mention is made.

11. GERMANY exhibits fair wood-hives, on the storied principle, probably well fitted for the climate.

12. GREECE.—A jar of *Hymettus* honey, from A. TETZIMBAKOS, of Athens (13, p. 1402), deserves Honourable Mention. The specimens were brought over in the original jars, and put removed into glass jars, whereby the quality is injured. The Rhodomele honey, from Carzeto, in Eubœa, exhibited by the Bishop of Eubœa (14, p. 1402), also receives Honourable Mention. It is rather more aromatic and pungent than that of *Hymettus*.

13. AUSTRIA sends honey, and a Carniolan apiary; neither is remarkable.

14. EGYPT.—Various honeys, in large jars, dirty, of lead colour, and peculiar flavour, and all in a state of fermentation.

15. TURKEY.—The honeys are generally of good colour and flavour. Of one sample (2918, p. 1386) Honourable Mention is made: it is of a fine rose flavour, yellow, and semitransparent.

16. TUNIS exhibits a sample of honey of the Egyptian character, and not fitted for the European market.

17. RUSSIA. A strong straw-hive is exhibited.

18. UNITED STATES. JOSEPH HALL, Burlington, New Jersey, sends a hive of living bees.

#### H. VI.—PREPARATIONS OF BLOOD.

The only examples are those of P. BROCCHERI (16), who attempts to utilise the nutritious principles of the blood of animals killed for food, by reducing it to a concentrated and dried state, for preservation during long periods. The first step is to prepare a liquid, considered innocuous and antiseptic by the exhibitor, by which various bloods are kept fluid and apparently fresh. Samples of these are exhibited. Another series of specimens shows the solid parts forming the crassamentum, or clot, in a dried and semicrystalline state. These solid constituents, including the gelatine, albumen, and fibrine, are

next produced, combined with small proportions of flour, in the form of light dry masses, like loaves, cakes, or biscuits. Lastly, they are shown combined with sugar, as cakes and bon-bons.

The larger masses, uncombined with sugar, are inodorous, almost flavourless, and may be made the basis of highly-nutritious soups. They are very uniform in composition, containing half the nitrogen of dried blood, or 44 per cent. of dry flesh, the equivalent of double the nutritive value of ordinary butcher-meat. Both the bull's and calf's blood gave 6½ per cent. of nitrogen, equal to 43 per cent. of flesh-forming principles.

The value of M. BROCCHIERI'S process depends on the power of preserving the results, in an undecomposed state, during lengthened periods, &c.; and though the Jury have understood that the preparations have been advantageously employed in long voyages with some success, the evidence is not complete; and the condition of some of the specimens of mixed blood and sugar, once in the Exhibition, was unsatisfactory. The uncombined dried cakes seem, however, adapted for this purpose. Hence, as a first attempt,—carried perhaps to a successful issue,—to render available for food and portable in form,

the otherwise wasted blood, M. BROCCHIERI'S experiments deserve encouragement and commendation; and the Jury have felt called upon to award him a testimonial of Honourable Mention.

## II. VII.—ISINGLASS.

Regarded as an alimentary substance, isinglass had little claim upon the attention of the Jury. They have, however, to report most favourably of the EAST INDIAN isinglass, obtained from the air-bladder of a siluroid fish called *Polynemus plebeius*, and exhibited by Dr. MACLELLAND. In quality this proved, after repeated tests, to be fully equal to the finest Beluga samples, and has received a Prize Medal. A similar distinction was conferred upon Mr. JAMES VICKERS (CL XV., 117, p. 204), for some very finely-prepared Russian isinglass, both in the whole and cut state, which the Jury satisfied themselves was of uniformly good quality. They are unable to express a favourable opinion of the Brazilian isinglass of the same exhibitor. (See Report, Jury, Class IV.)

New, August 1851.

J. D. JOOKER, REPORTER.

## CLASS IV.

## REPORT ON ANIMAL AND VEGETABLE SUBSTANCES, CHIEFLY USED IN MANUFACTURES, AS IMPLEMENTS, OR FOR ORNAMENTS.

[The figures after the Names (between parentheses) refer to the Exhibitors' Numbers and to the Pages in the OFFICIAL DESCRIPTIVE AND ILLUSTRATED CATALOGUE.]

## Jury.

Professor RICHARD OWEN, F.R.S., *Chairman and Reporter on the Animal Substances*, College of Surgeons, Lincoln's Inn Fields; Curator to the College of Surgeons.

A. PAYEN, *Deputy Chairman*, France; Member of the Institute, Professor to the Museum of Arts and Sciences, Member of the Central Jury, &c.

Judge E. S. DUNCAN, United States.

Dr. J. F. ROYLE, F.R.S., Heathfield Lodge, Acton; Professor of Materia Medica, King's College.

RAMON DE LA SAGRA, Spain; Corresponding Member of National Institute of France.

Professor E. SOLLY, F.R.S., *Reporter on the Vegetable Substances*, 15 Tavistock Square; Lecturer on Chemistry at Addiscombe.

N. WALLICH, M.D., F.R.S., 5 Upper Gower Street, Bedford Square; formerly Curator of the Botanical Gardens, Calcutta.

F. WEYHE, Zollverein; Councillor of Home Economy.

## Associate.

GEORGE PETERSON, Russia; 22 Craven Street, Strand; Member of the Scientific Committee for the Administration of the Domains of the Empire. (Juror in Class XXVIII.)

## PRELIMINARY REMARKS.

For the "Raw Materials" from the Vegetable and Animal Kingdoms mankind owes more to the powers and operations of Nature than to the inventions and appliances of Art, and in the series of the various organic products of almost every climate which are exposed to view in the "Exhibition of the Works of Industry of All Nations," the relative excellence of the objects to be compared might be deemed to be due rather to peculiarities of soil and sky than to the individual merits of the Exhibitors.

Almost every vegetable or animal substance may, however, be modified, and, in relation to its utility to man, improved by a change of the circumstances under which it is naturally developed, the modifications being suggested by a patient study of the respective influences of those circumstances upon the useful properties of such substance.

A further improvement may be effected by carefully defending the raw material during the progress of its development from all external influences calculated to deteriorate or injuriously affect it.

The value of every organic product in commerce is much influenced by the mode of its collection, or removal from the animal or plant when developed, and by the processes for separating the useless or less valuable parts or heterogeneous matters from the marketable constituent. In the sense in which the term 'Raw Material' has been extended in its application to that section of the Exhibition assigned to the Jury of Class IV., great scope for both chemical and mechanical skill has been afforded in the extraction and preparation of several of the vegetable and animal substances applied "in Manufactures, as Implements, or for Ornaments."

In the examination and comparison of the very numerous and diversified substances confided to their judgment, this Jury have been guided and influenced by the consideration of the invention, ingenuity, skill, and industry manifested in the amelioration and perfection of these several substances, and by the degrees in which unfavourable conditions of soil and climate have been thereby overcome; and in deciding on individual merit, they have carefully taken into account the natural facilities which may have favoured, and the natural difficulties which may have opposed, the realization of the desired qualities, in the produce transmitted for exhibition.

After a preliminary general survey of their field of operations had shown its vast extent and the great practical importance of the objects to be compared, the Jury, having regard, also, to the earnest desire expressed for explanation in their decisions, resolved themselves into two Committees, one for the Vegetable, the other for the Animal Kingdom; reviewing and testing from time to time in general meetings the evidence of the special examinations confided to those Committees. In preparing their Report of the results of these labours, it has been deemed advisable to divide it into corresponding sections, the classification of the subjects in each being made, as far as it was practicable, in accordance with that of the original "Jury Lists;" the chief differences being, that—"Dextrose" or starch-grain, and "Starch" as employed in manufactures, have been added to the "Gum and Resin" series, at the recommendation of the Jury of Class III., and that spermaceti, stearine, stearic acid, with the consideration of the various processes, partly chemical and partly mechanical, employed in the preparation of these substances, have been referred to the Jury of Class XXIX., in relation to the manufacture of candles and other practical applications of these substances, already under the review of that Jury. The "Vegetable Charcoal" has been added to the "Animal Charcoal," at the request of the Jury of Class I. "Quills" were transferred to other articles of stationery, the subjects of Class XVII. Lastly, the subdivision C, including the "Vegetable Acids," such as acetic, citric, tartaric, oxalic, and other organic acids employed in the arts being, in almost all cases, the products of distinct chemical operations, have been brought under the consideration of the Jury of Class II. Subject to these changes, therefore, in the list of objects originally assigned to this Class, the present Report will be subdivided, as respects the Vegetable Kingdom into eight heads, and as respects the Animal Kingdom into five heads; with a preliminary section explanatory of the grounds on which the awards of the Council Medal have been recommended.

## RECOMMENDATIONS FOR THE COUNCIL MEDAL.

Among the numerous samples of Raw Produce contributed by different countries, there are several collections of especial value, which derive additional merit from their completeness, and from the fact that they illustrate

the trade and manufactures of an entire country. The importance of such collections, not only in a commercial, but in a statistical and scientific point of view, is very great; and the Jury, therefore, being desirous of expressing their approbation of the practical benefits to be derived from the formation and study of such collections, and the advantages which the commercial and manufacturing community may obtain by their means, have determined to recommend the award of the Council Medal to the Governments of those countries the natural produce of which were thus so instructively and completely exhibited.

The Jury have, accordingly, recommended the award of a Council Medal\* to the HONOURABLE EAST INDIA COMPANY for the very valuable and important collection of the raw produce of the Indian empire exhibited by them (pp. 876-878), which illustrates in a remarkable manner the vast and natural resources of that empire, and places before manufacturers a number of valuable new or little-known substances, many of which are likely, hereafter, to become considerable articles of import.

The Jury have, on the same grounds, recommended the award of a Council Medal\* to the TURKISH GOVERNMENT for the very valuable and important collection of the raw produce of the Turkish empire (p. 1386), shown in the Turkish Department, and which, from its extent and completeness, is most interesting and instructive. Both this collection and that of the Hon. East India Company derive additional value from the fact, that the specimens are not merely picked samples of fine produce, but really represent the average quality of each article; and also from the exhibition of specimens showing the different degrees of goodness, and the comparative superiority or inferiority of the productions of different districts.

A Council Medal has also been awarded to the Government of SPAIN\* for the valuable and extensive collection of raw products, illustrating the natural resources of that country (pp. 1337, 1338).

The Jury have also recommended the award of a Council Medal\* to the FRENCH MINISTER OF WAR for the very complete and well-arranged collection of Raw Produce of Algeria (p. 1259), remarkable for excellence in many respects, and affording a good example of the progress and improvement of a young colony—in the amelioration of the native productions, and in the successful introduction and cultivation of new branches of industry—by the judicious application of practical science to the development of the raw materials used in various manufactures.

After comparing together the various samples of American cotton, and contrasting them with those of other countries, the Jury were desirous of testifying their admiration of the unrivalled excellence of the long-staple cottons of the United States, depending not merely on the length, strength, and silky fineness of the fibre, but being also due to the improved modes of culture, cleaning, and packing—the results of long experience and repeated efforts. The Jury found it quite impossible to decide between the minute shades of difference of the individual bales of cotton; besides which they considered that the merit was due not to any one exhibitor, but rather to the cotton-planters of America generally; they, therefore, recommended the award of a Council Medal\* to the GOVERNMENT OF THE UNITED STATES for the excellent samples of long-staple cotton shown, which exhibits such marked and superior excellence as to leave hardly any further improvement to be desired (p. 1431).

On the same grounds the Jury were desirous of testifying their sense of the peculiar value and excellence of the felting wools (p. 1005), adapted to the manufacture of the finest kinds of cloth, which are exhibited in the Austrian Department, by recommending the transmission of a Council Medal\* to the GOVERNMENT OF THAT EMPIRE. And with regard to the superior quality of the raw silks shown in the French Department, the Jury, by their recommendation of the award of the Council Medal\* to the "CENTRAL SOCIETY OF SILTICULTURE OF FRANCE,"

have desired to testify their admiration of the specimens exhibited by many members of that Society, and their appreciation of the important influence which it has exercised in the improvement of this beautiful and valuable product of the animal kingdom.

Two other collections, though not quite analogous to these, were, for similar reasons, deemed worthy by the Jury of the highest commendation, and have been accordingly recommended for the award of the Council Medal; namely, the collection of Messrs. LAWSON of Edinburgh,† and the series of Liverpool Imports. The former consists of a most complete and well-arranged collection of the vegetable productions of Scotland, the value of the whole mainly depending on the excellent systematic manner in which the specimens are arranged and classified; the careful and accurate information which accompanies the different samples; the manner in which the practical uses of each raw product are shown and illustrated; and the valuable catalogues which have been drawn up by Messrs. LAWSON.

The LIVERPOOL COLLECTION OF IMPORTS (Class XXIX., p. 803), though it does not of course represent either the exports or the imports of any individual country, is nevertheless, owing to the extensive trade of that port, and the large number of imports which it includes, a fair representation of a very large portion of the commerce of the country: like the preceding collection of Messrs. LAWSON, it derives much of its practical value from its arrangement, and from the useful information which accompanies each specimen. Much valuable knowledge, which no book can give, is to be obtained from the attentive study of this collection, as the different productions of various countries are, in it, placed side by side, with a memorandum appended to each, showing the quantity of it imported into Liverpool during the last ten years.

The Jury also recommended the award of a Council Medal to the Royal Society for the Improvement of the Cultivation of Flax in Ireland\* (p. 203\*), for their persevering and successful efforts to improve the growth and preparation of flax in the British empire. The Jury believe that the rapid and progressive advance which, during the last dozen years, has been made in the cultivation of flax in Ireland, is mainly, if not entirely, due to the exertions and influence of this valuable institution.

In the class of vegetable raw produce, the following subject was found to be of sufficient importance, in the opinion of the Jury, to merit special commendation, namely, MERCER'S Process for Modifying the Fibre of Cotton (Class XVIII., 48, p. 56); this was considered so valuable and so important a discovery that the Jury determined to recommend it as worthy of the distinction of a Council Medal. The process, itself, consists principally in steeping cotton in a dilute solution of caustic soda, the effect of which is, to alter the physical and chemical properties of the fibre in a very remarkable manner, causing each single fibre to reassume, to some extent, its original character and microscopic appearance, exchanging the ribbon-like or flattened appearance which cotton ordinarily presents, for one of a more or less distinctly cylindrical character. The shrinking of the fibre, which is thus caused, whilst it produces a most remarkable difference in the appearance of all woven fabrics, does not at all decrease its strength, but, on the contrary, renders it even stronger. At the same time that these physical alterations are produced, the chemical nature of the cotton is likewise modified, and its relation to colouring matter and mordants is changed in an equally remarkable manner; the prepared cotton taking the dyes more easily and far more perfectly than that which has not been prepared, so that the colour dyed in the same vat is far superior with the prepared than with ordinary cotton.

Among the vegetable charcoals which this Jury were requested to examine and report upon, they found worthy of special notice the following series, exhibited in France.

\* Owing to technical objections, these Council Medals were not passed by the Council of Chairmen.

\* Owing to technical objections, this Council Medal was not passed by the Council of Chairmen.

† This Medal was given conjointly with the Jury of Class III., in whose Award List it is inserted.

No. 1404, by M. POPELIN DUCARRE (p. 1243); viz., specimens of prepared charcoal in cylindrical masses, called 'charbon de Paris'; specimens of carbonized twigs and small branches of trees and of carbonized tan, accompanied with models of the machinery employed in the manufacture of the prepared charcoal.

The first merit of the ingenious invention here illustrated, and that which renders it of special importance in countries dependent on wood for fuel, is the modification of the ovens for carbonizing, without incineration, those small ligneous portions of plants and shrubs which had previously been of no value in the formation of charcoal, and were regarded as the waste of the forest: this mode of carbonization is equally applicable to underwood, furze-bushes, cane-brake, and even to the refuse tan of many manufactures. The charcoal thus produced, together with the dust from ordinary charcoal magazines, is then converted into a kind of artificial coke, in a manner analogous to that by which coal-dust has been for many years past converted into similar fuel in England. The produce of the ovens in M. Popelin Ducarre's extensive works is pulverized, mixed with a certain proportion of coal-tar or gas-tar (goudron de houille), and moulded into small cylinders, which are a second time submitted to carbonization. The machinery effecting these purposes is remarkable for its ingenuity and efficiency; and the result is a regular, solid, hard, heavy, but porous charcoal-coke, which is used with economy and success, as is amply testified by the Reports of the "Central Jury" of the Exposition at Paris in 1849, of the "Society of Encouragement," and of the "Central Society of Agriculture," of France, and by the written testimonials of many eminent manufacturers in France, requiring large quantities of an economical fuel. The "charbon de Paris" is peculiarly adapted for those manufactures in which a low and long-sustained heat is required to be maintained, and it is sold at a rate one-fourth cheaper than ordinary charcoal.

The Jury, appreciating the value of this invention of the ingenious Exhibitor, especially to countries which, like France, are not abundantly supplied with coal, have recommended the award of the Council Medal to M. POPELIN DUCARRE.

Amongst the series of wools shown in the French Department are specimens characterised by a well-skilled English Expert as "a wool of singular and peculiar properties—the hair glossy and silky, similar to mohair, retaining at the same time certain properties of the merino breed." This wool is exhibited under No. 245 (p. 1188), by J. L. GRAUX, of the farm de Mauchamp, Commune de Juvin-court (Aisne), as the produce of a peculiar variety of the merino breed of sheep.

The Jury entered into an inquiry, not only into the commercial value and application, but into the particulars of the production of this new kind of wool, and finding it to be one of the very few instances in which the origination of a distinct variety of a domestic quadruped can be satisfactorily traced, with all the circumstances attending its development well authenticated, a brief statement of these has been deemed appropriate in the present Report.

In the year 1828, one of the ewes of the flock of merinos in the farm of Mauchamp produced a ram which became remarkable for the long, smooth, straight, and silky character of the fibre of the wool, and for the smoothness of its horns: it was of small size and presented certain defects in its conformation, which have disappeared in its descendants. In 1829 M. Graux employed this ram with a view to obtain other rams having the same quality of wool. The produce of 1830 included only one ram and one ewe having the silky quality of the wool; that of 1831 produced four rams and one ewe with the fleece of that quality; in the year 1833 the rams with the silky variety of wool were sufficiently numerous to serve, of themselves, the whole flock. In each subsequent year the lambs have been of the two kinds; one preserving the characters of the ancient race, with the curled, elastic wool, only a little longer and finer than in the ordinary merino; the other resembling the rams of the new breed, some of which retained the large head,

long neck, narrow chest, and long flanks of the abnormal progenitor, whilst others combined the ordinary and better-formed body with the fine silky wool. M. Graux, profiting by this partial resumption of the normal type of the merino in certain of the descendants of the malformed original variety, at length succeeded, by a judicious system of crossing and interbreeding, in obtaining a flock combining the long fine silky fleece with a smaller head, shorter neck, broader flanks, and more capacious chest. Of this breed the flocks have become sufficiently numerous to enable the proprietor to sell examples of the breed for exportation. The crossing of the Mauchamp variety with the ordinary merino has also produced a valuable quality of wool, known in France as the "Mauchamp-merino." The fine silky wool of the pure Mauchamp breed is remarkable for its qualities as combing-wool, owing to the strength as well as the length and fineness of the fibre. It is found of great value by the manufacturers of Cachemere shawls, being second only to the true Cachemere fleece in the fine flexible delicacy of the fabric, and is of particular utility, when combined with the Cachemere wool, in imparting to the manufacture qualities of strength and consistence in which the pure Cachemere is deficient.

Although the quantity of the wool yielded by the Mauchamp variety is less than that given by the ordinary merinos, the higher price which it obtains in the French markets (25 per cent. above the best merino wools\*), and the present value of the breed have fully compensated M. Graux for the pains and care which he has manifested in the establishment of the Mauchamp variety.

The Jury, considering the quality of invention which has been superadded to the skill and industry requisite for obtaining the finer qualities of wool under any circumstances, in the development of the new variety of sheep yielding the specimens exhibited in No. 245, have recommended that the Council Medal be awarded to J. L. GRAUX.

The most remarkable progress in the economical extraction and preparation of pure gelatines and glues from the waste remnants of the skins, bones, tendons, ligaments, and other gelatinous tissues of animals, has been made in France, where the well-organised and admirably-arranged establishments for the slaughter of cattle, sheep, and horses in large towns, give great and valuable facilities for the economical applications of all the waste parts of animal bodies. Among the beautiful productions of this industry, the specimens exhibited by its chief originator, L. F. GRAUX, under No. 247 (p. 1188), merit peculiar approbation. They include different kinds of gelatine in thin layers, adapted for the dressing of stuffs, and for gelatinous baths, in the clarification of wines which contain a sufficient quantity of tannin to precipitate the gelatine; pure and white gelatines cut into threads for the use of the confectioner; very thin white and transparent sheets called papier glacé or ice paper, for copying drawings; and finally, a quantity of objects of luxury or ornaments formed of dyed, silvered, or gilt gelatines, adapted to a variety of purposes, and to the fabrication of artificial or fancy flowers. M. Grenet, who was the first to fabricate on a large scale, out of various residues of animal bodies of little value, these beautiful and diversified products, many of which had previously been derived from isinglass, has been deemed by the Jury to merit special notice in the present section of the Report, and they have recommended to him the award of the Council Medal.

A considerable number of collections of raw produce from various countries are exhibited, each including a number of different specimens, many of which, taken singly or in groups, are of importance, either from their novelty, their superior excellence, or the locality from which they are sent; the Jury considered it most advisable to treat each of these collections as a whole or unit, and they accordingly awarded Prize Medals for the following collections respectively:—

\* According to the able Report of M. A. Yvert, Inspector of the Veterinary Schools and National Sheepfold of France, p. 42.

To Hon. ~~Asst.~~-Colonel BUTTERWORTH, Governor of Prince of Wales' Island and Singapore, for a collection of raw produce from Singapore and the Straits (876-890).

To Major F. JENKINS, Chairman of the Assam Committee, for the collection of the raw produce of Assam.

To the AGRICULTURAL SOCIETY OF THE CAPE OF GOOD HOPE, for the collection of the raw produce of that colony (Nos 1 to 55, pp. 950, 952).

To the PRESIDENT OF THE MONTREAL COMMITTEE, for the collection of the timber and other woods of Canada (80, pp. 963, 964).

To the ROYAL AGRICULTURAL AND COMMERCIAL SOCIETY OF BRITISH GUIANA, for the collection of the raw produce of that colony (977).

To His Excellency Lord HARRIS, Governor of Trinidad, for the collection of the raw produce of Trinidad (pp. 973, 975).

To His Excellency Sir W. T. DENISON, Governor of Van Diemen's Land, for the collection of the raw produce of that colony (p. 993).

To Messrs. W. P. HAMMOND and Co., for a collection of the raw produce of Siam and the Indian Archipelago, including fine specimens of caoutchouc, gutta percha, gamboge, gums and resins, terra japonica, shells, ivory, isinglass, &c. (2, 988).

To the COLONIZATION ASSURANCE CORPORATION, per W. B. P. WOOD, for a collection of the raw produce of Western Australia (988).

To SIDI MAHMOUD BENYAD of Tunis, Commissioner for the Government of Tunis, for a collection of the raw produce of that country (1412).

To ABDUL HAMID of Alexandria, Commissioner for the Government of Egypt, for a collection of the raw produce of that country (1408).

To the PRESIDENT OF THE MARYLAND COMMITTEE, for a collection of specimens of the principal raw produce of that state (U. S. 371, p. 1459).

To the AGRICULTURAL BOARD OF VALENCIA, for the collection of raw produce (173, 109, pp. 1339 & 1342).

To the AGRICULTURAL BOARD OF SARAGONNA for the collection of raw produce (148, pp. 1337, 1338).

To Sir ROBERT SCHOMBURGK, H. M. Consul to the Dominican Republic, for specimens of the raw produce of that republic (1428).

To the ROYAL TECHNOLOGICAL INSTITUTE OF TUSCANY, for the collection of the raw produce of that country (47, p. 1294).

#### PART I.—VEGETABLE KINGDOM.

From the fact that the Exhibition is the first attempt to bring together a complete collection of the natural raw produce of all parts of the globe, and from the very different views which were entertained in various countries as to the nature of the Exhibition, and the kind of substances which it was desirable to collect and exhibit, it necessarily follows that the collection, viewed as a whole, is very incomplete. In some cases, abundant and numerous specimens have been sent of all the various kinds of raw produce, constituting the staple productions of the country, their value and importance having been evidently felt and acknowledged; whilst, in other instances, it is apparent that the mere raw materials of any manufacture have been regarded as of comparatively little importance, and are consequently either not shown at all, or else are but imperfectly and inadequately exhibited, in the form of small or inferior samples. This circumstance, whilst, on the one hand, it has perhaps somewhat diminished the labour of the Jury, has, at the same time, rendered their task even more difficult than it would have been had the entire collection been more uniform and complete. It is therefore necessary to bear in mind, that as the duty of the Jury was only to consider and decide on the individual merits of the different specimens exhibited, so it necessarily happens that in some cases they have to report,—as being the best sample shown,—a specimen of second-rate quality, and one, even, decidedly inferior to what is often met with in commerce as an import from some other country; specimens of which,

however, do not happen to be shown in the Exhibition. Every substance was examined carefully and considered separately; and in awarding a prize, it was only compared with substances of a similar nature. It is, of course, evident, that the award of a medal to two different things does not infer that they are of equal merit or importance; but, merely, that each taken separately, and upon its own merits alone, was found worthy of high commendation and approval. It is also right to observe, that as the value of any sample of raw produce does not rest merely on its own intrinsic superiority, but depends on a number of different circumstances, which may modify its value; so, even a second-rate sample, either from a new locality, or prepared by a new and more advantageous method, may have more real merit, and be more fully entitled to favourable mention, than a superior sample possessing no peculiar novelty, and deriving its excellence rather from accident than from either the skill or the ingenuity of the producers. These remarks apply to all the classes of subjects brought under the consideration of the Jury; but in no instance do they apply more strongly than in the case of gums and resins.

#### SECTION I.—GUM AND RESIN SERIES.

A great deal of practical inconvenience and confusion is caused by the indiscriminate manner in which the term "gum" is used in commerce and the arts: it would certainly be an advantage if the distinctions employed in scientific books were to be generally adopted by merchants and drug-brokers, the term "gum" being solely applied to those natural vegetable exudations which soften or dissolve in water, and yield a more or less perfect mucilage, but which are wholly insoluble in spirit;—the term "resin" being applied to those fusible and combustible vegetable substances which are quite insoluble in water, but which soften and dissolve in ether, the "essential oils," and "spirit of wine;" and the term "gum resin" being used to designate those mixtures of gum and resin, which are intermediate in properties, and partake of the nature of each, being partially and imperfectly soluble both in water and in alcohol.

"Gum," properly so called, is used in large quantities for a number of purposes in the arts: it is generally distinguished into soluble gum or gum-arabic, which readily and perfectly dissolves in water, forming a clear mucilage, and cherry-tree gum or gum-tragacanth, and those difficultly-soluble kinds of gum, which, though they soften easily, do not readily form mucilage. Gum is extensively used in finishing and giving lustre to crapes, silk goods, &c., by calico-printers, shoemakers, and in other trades. A very large quantity of British gum, "dextrine," or starch gum, is artificially prepared by roasting starch, and is extensively used as a cheap and strong form of gum for various purposes, especially in calico-printing, and in the manufacture of adhesive labels. The resins are, for the most part, used in the formation of varnishes and lacquers, for various purposes in dyeing, and in the manufacture of size for paper-makers, sealing-wax, &c. Those resins, which naturally contain a portion of volatile oil, such as the balsams, or oleo-resins like common turpentine, are used as sources of the volatile oils. Gum resins are chiefly used in medicine.

The total quantity of "gum" imported into England in 1848 and 1849, as shown by the Custom-house returns, was,—

|                                | 1848.  | 1849.  |
|--------------------------------|--------|--------|
|                                | Cwts.  | Cwts.  |
| Arabic - - - - -               | 24,032 | 33,136 |
| Senegal - - - - -              | 7,404  | 6,572  |
| Copal and anime (resins) - - - | 2,958  | 4,315  |
| Tragacanth - - - - -           | 236    | 344    |
| Total - - - - -                | 34,618 | 44,343 |

The largest import of gum, therefore, is of Arabic, and under this head a considerable variety is probably in-

cluded; the countries from which the 33,136 cwts. were imported in 1849, are as follows:—

|                        | Cwts.  |
|------------------------|--------|
| The East Indian Empire | 13,687 |
| Egypt                  | 6,332  |
| Moreocco               | 6,054  |
| South African Colonies | 4,876  |
| Italy                  | 664    |
| Gibraltar              | 460    |
| Aden                   | 397    |
| Australia              | 372    |
| France                 | 212    |
| Miscellaneous          | 172    |
| Total                  | 33,136 |

Of the resins and oleo-resins, the most important are turpentine and lac. Of the former, 412,042 cwts. were imported in 1849, nearly the whole of which was brought from the United States. The quantity of lac imported in 1849 was 14,786 cwts.; of this, 14,556 cwts. were the produce of the East Indian empire.

The collection of resins exhibited by E. REA (116, p. 204\*), shown as illustrations of the chief substances used in the manufacture of varnish and lacquers, &c., is complete and interesting, comprising a tolerably numerous series of the various resinous substances employed by manufacturers. The specimens are good, well arranged and shown. The collection includes a good series of lac, namely, the insects themselves, the *Coccus lacca*, which, living on the branches of various trees, cause the lac to form and collect as an incrustation on the young shoots and twigs. The chief varieties of lac known in commerce, both from Siam and from Bengal, namely, stick lac, seed lac, orange and ruby shell lac, lump and button lac; lac dye, and the various colours prepared from it; and white or bleached lac, together with samples of the lac wax, which separates from it during the process of purification. Of the hard resins, there are good specimens of copal, anime, kauri gum or New Zealand copal, damper or East Indian copal, colophony or rosin, the resin of common turpentine, sandrac or sandarach, mastic, dragon's blood, and the fine resin of the black-boy or grass tree of Australia, *Xanthorrhoea Australis*. Two perfectly distinct resins are obtained from the *Xanthorrhoea*, namely,

the "black-boy gum," a dark red brittle brilliant resin; and the "yellow gum," an orange yellow resin resembling gamboge, which contains benzoic and cinnamic acids. These valuable resins, it is said, may be had in large quantities, and at a low price; they are gradually coming into use in the manufacture of varnish, and for other purposes; being in some respects quite as good, if not superior to, shell lac. Bleached lac is extensively used in the manufacture of the finer sorts of sealing-wax: the wax which separates during the purification of the lac is comparatively little known; it is a hard substance, readily fusible, and may be well employed in taking casts, which it does with great sharpness. It is probable also that it might be advantageously used to mix with other and more fusible materials in the manufacture of candles. Of the oleo-resins and balsams there are varieties of common turpentine and Canada balsam, elemi, and thus or frankincense. The Jury awarded a Prize Medal for this collection.

A series of the ordinary turpentines of commerce is shown by ENGLISH'S PATENT CAMPHINE COMPANY of Hull (61, p. 199\*), accompanied by samples of resin, and refined oil of turpentine, and an interesting collection of the various insects found in crude turpentine. The specimens of resin are by no means first-rate; they serve merely as illustrations of the ordinary articles as commonly met with in commerce. The collection also contains a number of samples of oils and oil-seeds (see page 80). The Jury deemed the whole series worthy of Honourable Mention.

Some very capital specimens of various resins and gum-resins are exhibited in the interesting collection of the LONDON DRUG TRADE (Class II. 117, p. 199). These are especially valuable because several samples of each substance are shown, those of first-rate quality being contrasted with the ordinary commercial products. The Jury considered this part of the series well worthy of Honourable Mention.

In the very admirable and instructive collection of LIVERPOOL IMPORTS (see page 69, &c.) there is a numerous series of gums, resins, and gum-resins. The chief of these are enumerated in the following Table; the last column shows the quantity of each substance which has been imported into Liverpool during the last two years.

| Name.                     | Plant which yields it.                         | Whence Imported. | 1849<br>Tons. | 1850<br>Tons. Cwts. |

In the collection of imports, exhibited by the HULL COMMITTEE, there are samples of common turpentine and of resin from the United States; of the former, about 30,000 barrels, and of the latter, about 2,000 barrels are annually imported into Hull. Turpentine is separated by distillation into oil or spirit of turpentine, sometimes called camphine, and resin or colophony. In its raw state turpentine is of very little use; it is chiefly important as yielding those substances.

The collection of gums and resins, exhibited by the EAST INDIA COMPANY (pp. 376, 377) is very extensive and interesting, and forms an important division of the great collection of the raw produce of the Indian empire, for which the Jury have recommended the award of a Council Medal. The series is so numerous, and many of the substances which it contains are so little known in Europe, that it would hardly be possible, at present, to give any detailed report on the individual samples. In the following remarks, therefore, only a few of the more striking substances are noticed, whilst a great number of substances are necessarily reserved for future study and investigation. Even a slight examination of the natural raw produce of India shows the immense resources of the country; and when we remember the varied and abundant productions which may be had in almost unlimited quantities, and at very little more trouble than the mere cost of collection (or in such a soil and climate nature needs but little artificial aid), it is not saying too much to assert that no portion of the globe is more highly favoured by nature, or more able to supply those substances which minister to the wants and luxuries of mankind. With a fertile soil and a generous climate, vegetation of all sorts is rapid and luxuriant; and as labour is cheap and abundant, everything seems most favourable to agriculture and the growth of all vegetable products. There are, however, several great obstacles which have ever retarded the increasing prosperity of India, and which present the most serious difficulties in the way of its commercial development; especially the inert, careless, and indifferent habits of the natives, confirmed and kept up by religious peculiarities and long-established prejudices. Not only are the natives of India wholly ignorant of the value of many of the natural productions of the empire, and therefore quite indifferent to their very existence, but at the same time, alas, the manufacturers of Europe being unacquainted with many of these substances, or being ignorant that they may be had in almost unlimited quantities from our eastern possessions, do not avail themselves of the advantages which are in fact within their reach. Many of the natural productions of India will unquestionably become important articles of trade to this country, when their value is better known; and this result, whilst advantageous to our own country, will, at the same time greatly benefit India, and will lead to the construction of good roads, or other modes of transit, by means of which, internal traffic,

and the speedy, cheap, and safe carriage of merchandise may be effected. The continued and persevering efforts of European skill and capital, will no doubt in time, to a great extent, remove or diminish these obstacles; but, in the mean time, the evil effect which they produce on the natural advantages of the Indian empire is enormous.

Among the East Indian resins there are some interesting specimens of lac; the sample of shell-lac in large, thin orange sheets is of very superior excellence, and is altogether far above any met with in commerce.

The specimens of lac from Singapore, which is stated to be abundant in the jungles of the Peninsula, but has not hitherto been collected as an article of commerce, though not first-rate, are still highly commendable, and worthy of encouragement. The Jury deem them deserving of Honourable Mention.

Good samples of lac are also contributed from Bombay, from Ganjam, by A. P. OSLOW; by G. G. NICOL, from Siam; from Nepal, by His Highness the MAHARAJAH of NEPAL; from Ikerbloom, specimens of the two varieties called bala and chanch; and from the Rajpootana States, samples of bur-lac, or lac produced on the *Ficus indica*, also lac from the *Ficus religiosa*, *Zizyphus jujuba*, and the *Acacia concinna* or *Mimosa abstergens*. An interesting series of samples from Assam, illustrating the formation, collection, and uses of lac, is contributed by Dr. C. HUFFNAGLE. For this series, together with several other small collections of raw produce shown in illustration of the native manufactures of India, the Jury awarded a Prize Medal to Dr. Huffnagle.

The samples of gutta percha from Johore, Malay peninsula, contributed by W. KEAN, of Singapore, together with the illustrations of the native modes of working the substance, and the purposes to which it is applied, are interesting and important. It is to be regretted that the same careless and wasteful mode of collecting this valuable substance, as, for the most part, still employed, as was originally the case when it was first introduced into Europe eight years since by Dr. Montgomerie, of Singapore; namely, recklessly cutting down the large trees for the sake of a few pounds of the substance; from this, it naturally follows that the tree gradually becomes less abundant, and, consequently, ere long the price of the article will probably increase so much as to preclude it altogether from being used for many purposes. The Jury awarded a Prize Medal for this series. Some of the first samples of gutta percha (*Ionandra gutta*), sent over to the East India Company by Dr. Montgomerie, and for the introduction of which he received the Gold Medal of the Society for the Encouragement of Arts and Manufactures, in 1843, are exhibited by Col. BOSSUM of the East India House.

The specimens of gutta trap from Singapore, a substance evidently allied to gutta percha and caoutchouc, and employed there in the manufacture of bird-lime, is

interesting. It is stated to be the inspissated juice of an *Artocarpus*; and it is highly probable that there are a number of similar vegetable productions, such as the Atti jegota, *Ficus racemosa*, and Mangegatu, *Ficus indica*, from Vizagapatam, which might be advantageously introduced into commerce, and which could be profitably employed in the arts for similar purposes to those for which caoutchouc and gutta percha are now so extensively employed. The Jury deemed the specimen of gutta trap worthy of Honourable Mention.

The samples of caoutchouc or India-rubber are of considerable interest: those from Sumatra and Java, in particular, are deserving of notice. A considerable number of specimens of caoutchouc from different localities, and prepared in different manners, is shown by Dr. ROYLE (p. 869), including samples of India-rubber, obtained from the *Ficus elastica* in Assam by Captain Veitch, and some prepared by Dr. Scott; and a portion of the wood and juice of the *Urceola elastica*, from Singapore, is contributed by W. BROCKEDON, as well as a young plant of the *Ficus elastica*. A good series of samples of the different forms of India-rubber, commonly known in commerce, is also exhibited by Messrs. MACKINTOSH, in illustration of the various useful and beautiful applications which are made of it in the arts. Many of the specimens of East Indian caoutchouc, however, show that unfortunate "tackiness" which so greatly diminishes the value of some forms of India-rubber. The samples from Assam, in particular, illustrate the great importance of care and attention in the preparation of caoutchouc: the specimens sent over some years since by Captain Veitch are of excellent quality, and have not undergone any change since they have been in England. They were evidently formed from many successive layers of sap, each layer being allowed to dry before a fresh one was applied. On the other hand, many of the more recent specimens are sticky and in a partially decomposing state. These have plainly been formed by the coagulation of a considerable bulk of the sap rapidly collected; a little time and attention have thus been saved, but at the sacrifice of the most useful properties of the caoutchouc. All samples of India-rubber from new localities, where there is any probability of a large quantity being obtained, are valuable.

In connexion with these specimens, particular attention should be drawn to the Cuttemundoo, or Kattimundoo, a highly-interesting substance exhibited from Vizagapatam by Mr. W. ELLIOTT, and obtained from the Akoo Chenoodoo, or Bramha Chenoodoo, the *Phiphorbia antiquorum* of Roxburgh. It is of a dark-brown colour, opaque except in thin pieces, is hard and somewhat brittle at common temperatures, but easily softened by heat; in boiling water it is perfectly insoluble, but it becomes soft, viscid, and remarkably sticky and adhesive, like bird-lime; as it cools it re-assumes its original character. Heated, it melts and burns with a bright and smoky flame, at the same time giving out a peculiar odour, somewhat resembling that of burning caoutchouc or gutta percha.

This remarkable substance appears to be a hydrocarbon, closely resembling caoutchouc and gutta percha in chemical composition, but considerably different from both in physical characters. It is said to be used as a cement for joining metal, fastening knife-handles, &c.; and there is little doubt that it might be advantageously employed for a great number of purposes in the arts. Cuttemundoo merits a minute and careful examination; it promises to prove a valuable addition to the India-rubber series; and the Jury have accordingly awarded a Prize Medal to Mr. ELLIOTT for its introduction.

Excellent samples of the different forms of caoutchouc usually met with in commerce, are shown by LOCKINGTON, BURN, and Co. (Class XXVIII., 77, p. 1783); and some fine specimens of gutta percha, both in its rough state as imported, and also in the various stages through which it passes in the process of purification, are exhibited by the GUTTA PERCHA COMPANY (Class XXVIII., 85, pp. 1783, 1784); both these series of specimens, however, are merely shown in illustration of the various uses to which these substances are applied.

The sample of dragon's blood from Sumatra, called Heraduccun, being of superior quality, was deemed worthy of Honourable Mention.

Amongst the other collections of gums and resins, the specimens shown by J. LOCH, Esq. (88, p. 669, &c.), and contributed by His Highness the RAJAH of TRAVANCORE, are considered worthy of Honourable Mention. Besides these, the turpentine from Churra Poonjee, in the Dacca division (p. 669, &c.); the Bombax resin; the Saul gum, from the *Shorea robusta*, from Beerbhoom and from Bhagulpore; the Theetske resin, from Arracan; the Kerela resin, from Assam, contributed by Major HANWAY; the Danimar, from Malacca, Sumatra, Java, and other places, deserve notice. The numerous series of resins, &c., from Sarawak must also not be omitted; the names of these are as follows:—

- |                      |                      |
|----------------------|----------------------|
| 1. Melosampang.      | 15. Supok.           |
| 2. Merika.           | 16. Meng kabang.     |
| 3. Morkubong.        | 17. Miniak kapur.    |
| 4. Mintaugor jenkar. | 18. Rusuh.           |
| 5. Klabit.           | 19. Garmyong.        |
| 6. Singut.           | 20. Sulutong.        |
| 7. Monliarut.        | 21. Kandis.          |
| 8. Godoh.            | 22. Itabac-rrior.    |
| 9. Sampang.          | 23. Gutta percha.    |
| 10. Urut mata.       | 24. Taboo.           |
| 11. Liong sundok.    | 25. Gayu.            |
| 12. Mata kuehin.     | 26. Bulan yok.       |
| 13. Sarak palathan.  | 27. Gutta bintangor. |
| 14. N'ranli boya.    |                      |

In the following list the chief Indian gums and resins, &c., are necessarily placed under one common head, as, without a minute examination, it would not be possible to class them more accurately.

1. Babool gum, gond babool, &c., obtained from the *Acacia arabica*, or babool tree; an inferior sort of gum-arabic from Bengal.
2. Gattie gum, a variety of the babool gum, largely produced in the Decan, Coceag, and Guzerat; well known in commerce as East Indian gum-arabic; a specimen is also contributed from Bombay.
3. Kheir gum, the produce of *Acacia catechu*, closely resembling the preceding; from the Rajpootana states.
4. Jumma jegota (*Acacia leucophloea*); from Vizagapatam.
5. Keekur gond, babool tree (*Vachellia farnesiana*); from Bengal; both closely resembling the babool gum, and consequently varieties of arabic.
6. Wood-apple gum, obtained from the wood-apple, or *Feronia elephantum*; from Vizagapatam; a good and useful gum.
7. Margosa gum, from the margosa tree (*Melia azadirachta*); from Madura, Tiunnevely, and Palamcottah; inferior.
8. Mullaga jegota, from the *Moringa pterygosperma*; from Vizagapatam.
9. Pagada jegoto (*Mimusops elengi*); from Vizagapatam.
10. Tanjada jegota (*Cassia auriculata*); from Vizagapatam. These three appear likewise to be soft, with difficulty soluble, and inferior gums.
11. Ballec gond, or spurious tragacanth, obtained from the *Sterculia urens*; sent from Bombay.
12. Kuteer, (*Cochlospermum gossypium*), like the preceding, a sort of inferior tragacanth; contributed from Meerut.
13. Vateria resin, an excellent resin obtained from the *Vateria indica*, from which it exudes as a balsam in a semi-fluid state, constituting the peynie varnish; it soon becomes hard when exposed to the air. This resin is shown both in the fluid state and also when solidified; from Malabar and Canara.
14. Dhooa, or Saul dammar, a good resin abundantly obtained from the saul tree (*Shorea robusta*), common in the northern parts of Hindostan; contributed by His Highness the MAHARAJAH of NEPAL, and from Bengal and Bhagulpore, in the Moorshedabad district.
15. Soondroos, or copal; imported from Africa through Arabia, and often called anime.

16. Guggilam (*Vatica tamaris*); from Canara and Vizagapatam (p. 876).  
 17. Teindoo resin (*Diospyros* sp.); from the Rajpootana states.  
 18. Gaup resin, obtained from the Gaup tree (*Embryopteris glutinifera*); from Bhagulpore.  
 19. Mekhe-sa Dhoona, or Kerelu resin; from Assam.  
 20. Odina resin, a resinous substance obtained from the *Odina Wodier*, from Calcutta and from Meerut.  
 21. Nareeda jegota (*Eugenia jambolana*); from Vizagapatam.  
 22. Onbanum, saleh gond, Loban (*Boeswellia thurifera*); from Chota Nagpore, and Patna.  
 23. Cumbi resin, or Dikauali (*Gardenia lucida*); from Bombay.  
 24. Dammar (*Dummaria orientalis*); from Malacca, Java, Sumatra, and Borneo.  
 25. Jiladi pulu (*Calotropis gigantea*); from Vizagapatam.  
 26. Ammoniacum; imported from Arabia.  
 27. Assafetida (*Narthax assafetida*); imported from Persia and Sindh.  
 28. Bdellium (*Amyris commiphora*, *Balsamodendron Agallocha*). Of this two or three varieties are exhibited: the solid gum resin, and an oleo-resin or balsam, said to be obtained from the same tree; the former is frequently met with in commerce, being falsely called "myrrh," and sometimes under the name of "galbanum."  
 29. Myrrh; imported from Africa through Arabia, &c.  
 30. Dragou's-blood; imported from Aden, also from Borneo.  
 31. Gamboey; from Singapore, Mysore, Canara, &c.  
 32. Camboley (*Morus indica*); from Paulghat.  
 34. Manudi jegota (*Mangifera indica*).  
 35. Dadinia jegota (*Punica granatum*); from Vizagapatam.  
 36. Benzoin (*Styrax benzoin*); from Sumatra: specimens of a similar resin, also called benzoin, are contributed from Malabar and Canara.  
 37. Storax; from Rajpootana states.  
 38. Turpentine (*Pinus Khasyana*); from Churra Poonjer, in the Coeca division, and from Ullwar.

39. Moechrus (*Bombax heptaphylla*), a gum; from Calcutta bazaars.

41. Manjegota (*Ficus indica*); from Vizagapatam.  
 42. Atti jegota (*Ficus rucemaga*); from Vizagapatam.  
 43. Nepalapi palu (*Jatropha curcas*); from Vizagapatam and Ganjam.

44. Coorg resin, a pale green and very excellent resin; from Coorg, contributed by His Highness the RAJA of TRAVANCORE. It seems to deserve further inquiry and examination, as it might probably be well adapted for varnishes, &c.

Besides these, a very considerable number of other Indian resins, gums, and gum resins, is included in Dr. ROYLE'S extensive collection of the raw produce of India; amongst these are many of the preceding ones, and also the following:—

45. Galbanum; from Surat.  
 46. Cherry gum (*Prunus puddam*); from Surat.  
 47. Sem ke gond, or gota gond (*Bauhinia Vahlit*); from Deyra and Rajpore.  
 48. Labdanum, or laban (*Cistus ladaniferus*); from Surat.

49. Mastic, or mustagee (*Pistacia lentiscus*); from Caubul.

50. Scammony, or sukmoonny (*Convolvulus scammonia*); from Surat.

51. Kunnee gond, or jingun ke gond (*Leica resinifera*); from the Khera Pass.

52. Toon ke gond (*Cedrela toona*).

53. Sohunjue ke gond (*Moringa pterygosperma*).

According to Mr. Thomas, the "gum" of Coimbatore is a mixture of various gums and resins: he mentions twenty-four different plants, the natural exudations of which are collected; and he observes that they are said to be nearly all collected promiscuously, and sold in the aggregate as gum—the mass being, of course, very impure; but that, when dissolved in a large quantity of water, and strained through a fine cloth, it yields a solution from which a good and very adhesive gum may be obtained by evaporation. The plants from which these various substances thus associated together are collected, are, according to Dr. Wight—

|                     |   |   |                       |   |   |                            |
|---------------------|---|---|-----------------------|---|---|----------------------------|
| Vilvey pisin        | - | - | Egle marmelos         | - | - | Good arabic.               |
| Xvarum pisin        | - | - | Cassia auriculata     | - | - | Brown and soft.            |
| Vullam pisin        | - | - | Feronia elephantum    | - | - | Good arabic.               |
| Vel Vaila marum     | - | - | Acacia ferruginea     | - | - | Inferior.                  |
| Vaypum marum        | - | - | Melia azadirachta     | - | - | Tolerable.                 |
| Mah marum           | - | - | Mangifera indica      | - | - | Inferior.                  |
| Curvalala marum     | - | - | Acacia arabica        | - | - | Inferior.                  |
| Ellipie marum       | - | - | Bassia longifolia     | - | - | Inferior.                  |
| Yellandie marum     | - | - | Zizyphus jujuba       | - | - | Not a true gum.            |
| Murungoo pisin      | - | - | Moringa pterygosperma | - | - | Soft, difficultly soluble. |
| Kerrey vaugay marum | - | - | Acacia odoratissima   | - | - | Tolerable.                 |
| Vellay nagali marum | - | - | Conocarpus latifolia  | - | - | Tolerable.                 |
| Choor Kullie marum  | - | - | Soymeda febrifuga?    | - | - | Tolerable.                 |
| Mullee vemboo       | - | - | Melia azadirachta     | - | - | Inferior.                  |
| Vellay bootallie    | - | - | Sterculia urens       | - | - | Inferior tragacanth.       |
| Vengay marum        | - | - | Pterocarpus marsupium | - | - | Inferior kino.             |
| Kodawah porsh       | - | - | Chloroxylon Swietenia | - | - | Inferior.                  |
| Cat oolugoo marum   | - | - | Bombax malabaricum    | - | - | Good colour, but inferior. |
| Carabemboo marum    | - | - | Garuga pinnata        | - | - | Inferior.                  |
| Vunny marum         | - | - | Prosopis spicigera    | - | - | Good arabic.               |
| Curra Gallie marum  | - | - | Acacia sundra         | - | - | Very good arabic.          |
| Vidah vullie marum  | - | - | Vachellia farnesiana  | - | - | Soft, red, inferior.       |
| Wadallee marum      | - | - | Acacia catechu        | - | - | Inferior.                  |
| Peru marum          | - | - | Allanthus excel.      | - | - | A resin.                   |
| Woody marum         | - | - | Odina Wodier          | - | - | Tolerable.                 |
| Narvallie marum     | - | - | Cordia Rothia         | - | - | Inferior.                  |

From this list it is evident how much the value of the good gum must be deteriorated by the inferior gums and resinous matter mixed with it: a little care in the collection, only the better sorts being chosen, would be amply repaid by the increased value of the article.

The very remarkable wood-oils and native varnishes of India, obtained from various species of *Dipterocarpus*, belong properly to the "resin" series, and may therefore be mentioned here in connexion with the balsams and oleo-resins. These curious substances, though fluid

when first obtained, soon harden and solidify (p. 876); they constitute the basis of the best Burmese and other eastern varnishes and lacquers. Specimens of the *Thetsee*, *Melanorrhoea naitatisima*, employed as a lacquer, from Arracan, of the Thesakthu, also used in Arracan, in the manufacture of *papier-mache* work, and in rendering umbrellas water-proof; and of the Gurlung, or wood-oil, from various *Dipterocarpi*, from Madura, Timewelly, Chittagong, Pegu, and Mahurmanee, are shown. The "Thee-see" or varnish-tree of the Burmese, is spread

over a wide range of country extending from Manipur (lat. 23° N., long. 94° E.) to Tavoy (lat. 14° N., long. 97° E.). It attains its greatest size in the valley of Kubbu, distant about 200 miles from the sea-shore. The trees average from 30 to 40 feet high, and have a circumference of from 5 to 11 feet, 4 feet above the ground. A good tree yields about 10 or 12 lbs. of varnish, annually, and its value at Prome, on the Irawaddi, is about 10d. the pound: it is used in enormous quantities by the natives. Dr. Wallich states that the natives never experience those deleterious effects from handling the varnish in its liquid state which Europeans generally suffer: in its fresh state it has very little pungency of taste, and is altogether devoid of smell. The natives are very apt to adulterate that brought to market with sesamum oil. The "Gurjun-tree," which flourishes in the same districts, and especially in the valley of Kubbu, attains very large dimensions: Captain Grant describes it as having a straight stem of more than 40 feet to the first branch, and a circumference of 13 feet and upwards.

Samples of the empyreumatic oil of teak-wood are contributed by W. P. HONSLER, from Palamcottah. Two remarkable oils, apparently analogous to the wood-oils, are contributed from Coorg, but without any information; one of these, a thick blood-red oil, is stated to be obtained from the *Rottlera tinctoria*.

Interesting specimens of the "Calambak" or eagle-wood, the true lignum aloes or *Lignum parudisi*, so highly esteemed in the East as a perfume or incense, are shown in the East Indian collection. This remarkable wood, which contains a large quantity of an odoriferous oleo-resin, is called "Kayu Garu" in the Indian Archipelago, and is produced by the *Acerylum agallochum*, Lour.: when heated it undergoes a sort of imperfect fusion, and exhales a fragrant and very agreeable odour. Its price in Suggatra is about 30l. per cwt.: inferior specimens are likewise contributed from Malacca. Eagle-wood is also obtained from several other trees, as from the *Aquilaria agallocha* in Silihet. The true eagle-wood is, however, very scarce.

The specimens of African gums and resins from Aden, sent by the BOMBAY COMMITTEE, and exhibited in the East Indian collection, are remarkably fine. The samples shown are varieties of myrrh, olibanum, dragon's-blood, and gum-arabic.

The collection of gums and resins exhibited by T. A. PIERIS, of Kandy (p. 938), is interesting; unfortunately, it is not accompanied by any botanical or statistical information, which considerably diminishes its practical value. The specimens shown are labelled—

- |                 |                     |
|-----------------|---------------------|
| 1. Diwol gum.   | 7. Othium gum.      |
| 2. Devul gum.   | 8. Kos gum.         |
| 3. Gokhuto gum. | 9. Iliek.           |
| 4. Kekuna gum.  | 10. Gamboge.        |
| 5. Dammar.      | 11. Hildunamel gum. |
| 6. Kohombe gum. | 12. Cadjio gum.     |

Of these specimens it may be observed that No. 2 seems to be excellent gum "arabic;" No. 7 resembles inferior gum-arabic; and No. 1 appears to be a variety of "Cherry-tree gum;" Nos. 4, 8, 9, and 11 are resins, and apparently not of any great value; No. 3 seems to be a kind of gamboge; No. 10 is gamboge, probably obtained from the *Hebradendron cambogides*, and No. 12, though it seems to be a difficultly-soluble kind of gum, like Nos. 1 and 7, is remarkably pure and of good colour. The Jury deemed this series worthy of a Prize Medal, in conjunction with the collection of oils from Ceylon, also shown by the same exhibitor (see p. 82).

Very few specimens of African gums or resins are shown. A tolerable sample of the gum of *Acacia horrida*, and a fair specimen of mixed gum arabic from the Cape of Good Hope, is exhibited (p. 952). Mr. WARWICK WATSON exhibits a fair sample of "copal," from the Western coast. There are also shown a fine sample of gum-arabic from Ayer and Touat; a light-coloured resinous substance resembling copal, from Abbeakuts; a black, pitch-like matter from Timbuctoo, called Bekhoori or Bencae; and a resin used by the natives of Bornou as

incense, and called Omm-el-harker, or "the mother of blessing."

T. B. DUGGON (49, p. 980) exhibits a fine sample of anime, said to be abundantly produced by the *Simiri*, or locust-tree, on the river Berbice: this was deemed worthy of Honourable Mention.

A specimen of Hawai gum, a variety of frankincense, from the river Demerara, is shown by J. OUTHRIDGE (51, p. 980), who also shows a sample of indifferent caoutchouc, from the Demerara river (47, p. 980). G. R. BONYUN (50, p. 980) exhibits some Karman, a black resinous substance, said to be the inspissated exudation of the mannee-tree, and used by the fishermen on the river Essequibo to preserve their nets: it has, however, the appearance of being an artificial compound, containing wax. A good sample of balsam of copaiba, from the Pomeroon river, Essequibo, is exhibited by J. S. STUTCHBURY (46, pp. 979, 980).

Fine specimens of anime from the locust-tree (*Hymenaea courbaril*), from Arima (p. 973), and also of incense (*Trichilia trinitensis*), are shown in the collection of raw produce of Trinidad, sent by his Excellency LORD HARRIS, the Governor (see p. 71).

Several good specimens of resin and gums are shown in the Australian and Van Diemen's Land collections, including the gums of the black and silver wattle, *Acacia mollissima* and *dealbata* (No. 296, p. 998), shown by Lieutenant SMITH, R.N., deemed worthy of Honourable Mention; and other varieties of gum-arabic; and some fine samples of the Grass-tree gum, or "Black-boy gum," the resin of the *Xanthorrhoea Australis*. The specimens of Australian gums and resins exhibited by the COLONIZATION ASSURANCE CORPORATION are particularly fine; including several varieties of affinie, or acacia gums, and the *Xanthorrhoea* resins, they form part of the collection for which the Jury have awarded a Prize Medal (see p. 71).

The resins shown by J. MILLIGAN, of Flinders' Island, Bass's Straits, including specimens of the "Black-boy gum" (*Xanthorrhoea* resin, 81, p. 994); the fine pale resin of the Oyster-bay pine (*Callitris Australis*), from the eastern coast of Van Diemen's Land, and the *Acacia mucronata* gum, also from Flinders' Island (234, p. 997), were likewise deemed worthy of Honourable Mention.

A fine sample of Kauri, or cowae copal, the produce of *Dammara Australis*, a very beautiful resin from New Zealand, exhibited by W. BROWN (107, p. 1001), was deemed worthy, by the Jury, of a Prize Medal. It is stated that this resin may be obtained, in any quantity, in the Northern parts of New Zealand, ranging from 20 miles south of Auckland to the North Cape. A small sample of this resin, exhibited by G. M. MITTFORD, was deemed worthy of Honourable Mention.

Some excellent specimens of lac, benjamin, dammer, gutta percha, and caoutchouc, &c., from the Eastern Archipelago, are exhibited by Messrs. W. P. HAMMOND and Co. (p. 988), in the collection of raw produce, for which a Prize Medal has been awarded by the Jury (see p. 71).

Dr. FEUCHTWANGER, of New York (469, pp. 1464, 1465), has shown a very excellent specimen of bleached shell lac. This was deemed deserving of Honourable Mention.

In the Mexican collection is a sample of a remarkable orange-coloured resin, called Pipitzahuac, but of which no particulars are given.

The Egyptian collection of raw produce, for which, as a whole, a Prize Medal has been awarded by the Jury (see p. 71), contains some good specimens of gum (130, 131, p. 1409). The selected gum of Sennaar is of excellent quality, and was deemed worthy of Honourable Mention.

The purified turpentine shown by J. F. FLEURY, of Bordeaux (214, p. 1184), prepared by a patent process, was found to be excellent, and therefore deemed worthy of Honourable Mention.

A fine sample of copal, from Angola, shown in the Portuguese collection by F. R. BATALEA (458, p. 1332), was also deemed worthy of Honourable Mention.

An excellent series of specimens of turpentine, and of the resins and volatile oil obtained from it by distillation, is shown by FLORES, CALDERON, & Co., of Burgos (341,

p. 1844). It was deemed deserving of Honourable Mention.

In the Turkish collection, very good samples of the ordinary gums and resins for commerce are shown, including the following:—

|                    |   |   |             |
|--------------------|---|---|-------------|
| 1. Gum-arabic      | — | — | Egypt.      |
| 2. " "             | — | — | Tripoli.    |
| 3. Gum-tragacanth  | — | — | Damascus.   |
| 4. " "             | — | — | Sparta.     |
| 5. Gum cherry-tree | — | — | Damascus.   |
| 6. Caramanlacum    | — | — | Kouiah.     |
| 7. Pine resin      | — | — | Asia Minor. |
| 8. " "             | — | — | Smyrna.     |
| 9. " "             | — | — | Broona.     |
| 10. " "            | — | — | Kontah.     |
| 11. " "            | — | — | Berkoffcha. |
| 12. " "            | — | — | Wallachia.  |
| 13. " "            | — | — | Tripoli.    |
| 14. Mastic         | — | — | Solo.       |
| 15. " "            | — | — | Kouiah.     |
| 16. Sandarach      | — | — | Kaisarieh.  |
| 17. Storax         | — | — | Smyrna.     |
| 18. " Liquid       | — | — | Asia Minor. |
| 19. Balm of Mecca  | — | — | Mecca.      |
| 20. Labdanum       | — | — | Rhetino.    |
| 21. Libanum        | — | — | Arabia.     |
| 22. Resin (?)      | — | — | Anatolia.   |

The samples of arabic and of mastic are excellent. It is stated that the resin from Anatolia is used for making the handles of knives, and for similar purposes.

#### STARCH SERIES.

In examining the starch series, or rather the starch and starch-gum or dextrine series, the Jury have only taken notice of those substances prepared especially for manufacturing purposes, or which they conceived might be advantageously employed by manufacturers. They have altogether passed over those forms of starch and farina intended, specifically, as articles of food, or which, from their cost or the mode in which they were prepared, would not be suitable for the former purposes.

The specimens of starch from rice, exhibited by Messrs. ORLANDO JONES & Co. (Class III., 128, p. 208), are remarkably good. Rice contains, on an average, about 84 per cent. of starch; but, till comparatively a few years ago, no starch was manufactured from it, notwithstanding its low price and the large quantity of starch which exists in it. The reason of this was, that the old process of fermentation, by means of which starch is procured from grain, was not found to be applicable to rice; and hence the latter only became available as a source of starch in 1840, when Mr. O. Jones introduced his new process, for which he obtained a patent. This process consisted in macerating the rice for about 20 hours in a dilute solution of caustic potash, containing about 200 grains of the alkali in every gallon; the liquor is then drawn off, the rice dried, reduced to powder by grinding, then a second time digested in a similar alkaline lye for 24 hours, repeatedly agitated: after this it is allowed to settle, and well washed with pure cold water. The Jury awarded a Prize Medal to Mr. O. Jones for his rice starch.

Mr. S. BRONCKA (Class III., 130, p. 208), of Bromley, also exhibits starch prepared from rice, which is of similar excellence, though said to be prepared in a different manner. In place of employing a dilute solution of caustic potash to dissolve the "gluten" and other insoluble matters of the grain, Mr. Berger uses a solution of carbonate of soda, containing half-a-pound to the gallon. The rice is steeped in cold water for 48 hours; levigated in a suitable mill; and the pulp thus formed is treated with the solution of carbonate of soda for 60 or 70 hours, being repeatedly stirred: it is then allowed to settle for some hours, the alkaline liquor is drawn off, and the starch is washed and purified. This process was patented by Mr. Berger in December 1841. The Jury awarded a Prize Medal to Mr. Berger for his rice starch.

A third series of samples of rice starch, also prepared by a different process, is exhibited by Messrs. J. and J. COLEMAN (Class III., 117, p. 207), who also show good specimens of ordinary wheat starch, and dextrine or

British gum. In February, 1842, Mr. Colman took out a patent for the manufacture of starch from rice, by the action of dilute muriatic acid, which was employed for the same purpose as the caustic potash and carbonate of soda in the patents of Messrs. O. Jones & Berger. The samples exhibited by Messrs. Colman are excellent, and the Jury consequently awarded to them a Prize Medal.

Some very good specimens of starch and starch-gum are exhibited by R. G. TUCKER, of Lenton, near Nottingham (Class III., 121, p. 207). The former in the state in which it is used by the Nottingham lace-dressers; the latter, as it is obtained by the action of a carefully-graduated temperature in starch; fit for the use of dyers, who use it to give body and thickness to the colours which they employ in dyeing cotton, woollen cloths, and silk. It is also used by paper-stainers, or printers; and as a cheap but strong gum in the manufacture of adhesive labels. The specimens shown by Mr. Tucker are excellent, and the Jury awarded to him a Prize Medal.

In the preceding cases, account has been taken not merely of the superior excellence of the samples of starch, but at the same time the Jury have also taken into consideration the novelty or ingenuity of the process, and other circumstances which appeared to them to demand peculiar notice. The specimens shown by Messrs. BROWN & POLSON, of Paisley (Class III., 123, p. 208), consisting of several varieties of starch and dextrine from wheat, potato, and sago, are good, and deserve Honourable Mention. The preparation of starch from sago, or rather the purification of sago meal, which consists chiefly of starch, is now carried on to a very considerable extent. Messrs. Brown & Polson appear to have been the first to employ chemical means in bleaching or improving the colour of sago-meal, and by the introduction of certain improvements in this process they succeeded in rendering the bleached starch more perfectly soluble in water than it is in its ordinary state. The samples exhibited by Messrs. RECKITT & SON, of Hull (Class III., 125, p. 208), of the same substances, are also deserving of Honourable Mention. The other samples of starch shown by the English Department are all good; and several of them, indeed, judged merely for quality alone, are excellent. Some very beautiful starch, prepared from sago, is shown by R. WOTHERSPOON, of Glenfield, near Paisley (Class III., 124, p. 208). The Jury deem these, and likewise the samples of potato-starch shown by E. TUCKER, of Belfast (Class III., 122, pp. 207, 208), each deserving of Honourable Mention.

The Jury also deem worthy of Honourable Mention, the specimens of starch shown by Messrs. SHAND and MUCKART, of Montrose (Class III., 126, p. 208); and that of A. STEINHOUSE, of Perth (Class III., 154, p. 193\*).

An excellent series of specimens of starch from various sources is exhibited by Messrs. D. and W. MILLER, of Musselburgh, near Edinburgh (Class III., 127, p. 193\*). The Jury considered these, as well as the specimens of starch and dextrine shown by C. COONEY, of Dublin (Class II., 70, p. 200\*), and those of H. C. JENNINGS, of London (Class II., 99, p. 197), severally deserving of Honourable Mention.

In the collections of the HONOURABLE EAST INDIA COMPANY (pp. 874, 875), there are several samples of starch suitable for manufacturing purposes; and there is little doubt that they might be prepared in any quantity, and sent over at a low price, as the Rajah of Vizianagram states that any quantity of excellent arrowroot may be had in the northern Circars for about 4s. 6d. per cwt.

The specimen of Maranta starch, or arrowroot, of Messrs. COCKBURN, of Moorsheadabad (pp. 874, 875), is particularly fine, and the Jury accordingly awarded to it a Prize Medal.

The Cassava starch, or fecula of the *Jatropha*, exhibited by Messrs. SPEEDY, of Calcutta (pp. 874, 875), was also found to be remarkably good, and the Jury accordingly awarded to it a Prize Medal.

Good specimens of sago, and sago-meal or flour (pp. 874, 875), obtained from the sago-palm, *Arundo saccharifera* (*Saguerus Rumphii*), are contributed from Sumatra, Singapore, and Cuttack.

Besides these, good samples of similar kinds of starch are exhibited by T. OXLEY, of Singapore (pp. 874, 875), from various parts of the Indian Archipelago, Borneo, Moluccas, Java, Singapore, &c., and by other individuals, from Calcutta, from Assam, from Cutjack, Vizagapatam, Tenasserim provinces, Rhutmagherry, &c.

Some good specimens of starches are also shown in the Ceylon Department (p. 937), especially arrowroot, and the fecula of the *Jatropha*.

From Western Africa, a fair sample of arrowroot, together with the plant from which it is obtained, is shown by WARWICK WESTON (1, p. 952).

In the Canadian Collection, J. PRENDERGAST (125, p. 966) exhibits two specimens of starch, apparently prepared from wheat, one being white, and the other coloured blue, for domestic use. These are both very good, and the Jury deemed them worthy of Honourable Mention.

A specimen of starch from potatoes is also shown by BRUNSEN & SHIPTON, of St. Hilaire (128, p. 966). This also was deemed worthy of Honourable Mention.

In the excellent collection of raw produce from British Guiana, sent over by the ROYAL AGRICULTURAL AND COMMERCIAL SOCIETY of the Colony, and for which the Jury have awarded a Prize Medal (see p. 71), there are two specimens of starch which are peculiarly deserving of notice: these are, starch from the bitter cassava, and arrowroot, prepared by H. T. GARNETT, of Herstelling River, Demerara (31, p. 979), for this the Jury awarded a Prize Medal; and for the starch from the sweet cassava, plantain and buck yam, from the eastern coast of Demerara, exhibited by D. SMITH (33-35, p. 979), the Jury also awarded a Prize Medal.

Very fine samples of arrowroot and other starches are shown in the collection of Trinidad raw produce, transmitted by the Governor, Lord HARRIS. The samples of cassava or *Jatropha* starch, arrowroot, and Tulima or *Tous-les-mois*, are excellent (p. 974), and were considered especially to deserve Honourable Mention. It is stated that the cultivation of the cassava from which this starch is obtained is found to be very profitable, the yield being from one to two tons per acre.

Two good specimens of arrowroot from Bermuda are shown: the Jury deemed that of — GRAY (61, p. 971) worthy of Honourable Mention.

Some fine arrowroot from Norfolk Island is exhibited by Sir W. T. DENISON (25, p. 993), and a very good sample of starch, apparently from wheat, is shown by W. MUNNAY, of Hobart Town (18, p. 993). The Jury deemed both of these specimens worthy of Honourable Mention.

The OSWEGO STARCH FACTORY, of New York (104, p. 1440), shows some samples of starch manufactured from maize or Indian corn, of superior quality, for which the Jury awarded a Prize Medal.

Some very fine samples of pearl starch are also shown by W. COLMATE & Co., of New York (301, p. 1453): to these, likewise, the Jury awarded a Prize Medal for excellence.

An interesting series of flour and starch prepared from maize is contributed by B. R. KINTLAND, of Greenbush, New York (84, p. 1438). Among these samples of the various products obtained from maize are specimens of oil.

Good specimens of dextrine or starch-gum are shown by S. ENGELMANN, of Karolinenthal, near Prague (Austria 22, p. 1008). The Jury awarded a Prize Medal for these preparations.

Several samples of starch are shown in the Belgian collection. Especially deserving of notice is the starch prepared from maize by C. VAN GELTERUYEN, of Staume (East Flanders 489, p. 1166). The Jury awarded to this a Prize Medal.

Very good potato starch, prepared from diseased potatoes, is shown by BOCCUZZI & PARYS, of St. Jose-ten-Noode, near Brussels (68, p. 1158). This was deemed deserving of Honourable Mention.

The samples of white and blue starch manufactured by B. BOCKEN & Co. (78, p. 1158); the potato-starch of C. VAN BUNNEN, of Bruges (74, p. 1158); and the potato-

starch of G. BLYCKAERTS\* of Tirlemont (78, p. 1158), were also good, and the Jury deemed them severally deserving of Honourable Mention.

In the French Department there are several exhibitors of starch and starch-gum, derived from different sources. Amongst the specimens most deserving attention is the starch shown by L. RUXZ, of Cambrai (363, p. 1194): to this the Jury awarded a Prize Medal.

An excellent series of starches and dextrines, manufactured for the use of calico-printers, is shown by J. J. STEINBACH, of Rouen (382, p. 1195): the Jury considered these of superior quality, and accordingly awarded to them a Prize Medal.

A very superior sample of starch is likewise exhibited by BELLEVILLE BROTHERS, of Nancy (1078, p. 1229); for this also the Jury awarded a Prize Medal.

Good samples of well-prepared potato starch are shown by H. LEBLEIS, of Pont l'Abbé, Finistère (570, p. 1205), and by L. LE PAISANT, also of Pont l'Abbé (590, p. 1206). A good specimen of wheat starch is exhibited by VÉZON BROTHERS, of Ligné, Poitiers (1520, p. 1249), and some well-manufactured starches from wheat and potatoes are shown by H. BLEUZE, of Paris (1091, p. 1238), and some excellent dextrine by M. AUGAN, also of Paris (12, p. 1170). The Jury deemed these five severally worthy of Honourable Mention.

Starch obtained from a species of *Canna* (*C. discolor*) is shown by M. CHAPPEL, of Kouba in Algeria (16, p. 1260). This, though exhibited really as an article of food, the Jury deemed worthy of Honourable Mention in connexion with the other forms of starch suitable for manufacturing purposes.

A considerable number of specimens of starch, &c., are shown in the collection of the Zollverein States, and several of them are of excellent quality. In particular, the wheat starch manufactured by J. C. HALLER, of Halle (690, p. 1088), is deserving of special commendation, and the Jury accordingly awarded to it a Prize Medal.

The "improved" potato starch manufactured by A. C. WELCKER, of Walle-theim, near Schlenitz (331, p. 1069), and said to be extensively used for stiffening muslins, is likewise highly deserving of praise, and the Jury, therefore, awarded a Prize Medal to it.

The Jury also award a Prize Medal to A. WERTH and Co., of Bonn (333, p. 1070), for their superior potato starch.

Samples of wheat starch, manufactured by A. T. KREUSE, of Stralsund (19, p. 1049), C. G. KRAMSTA and SONS (123, p. 1055), and by BURKE and KÜSTER, of Lübeck (827, p. 1095), were severally deemed worthy of Honourable Mention.

Starches prepared from potatoes by L. VON UCHTRITZ, of Mühlrödtitz, in Silesia (21, p. 1069), by L. EIPENSCHLEID, of Neuwied (330, p. 1069); and the sago and potato starch of F. WART, of Neuwied (332, p. 1070), were also deemed, each of them, deserving Honourable Mention. Some good samples of potato starch, and starch gum, are also shown by the LONROD FACTORY at Magdeburg (694, p. 1088).

In the collection from the Netherlands, three exhibitors of starch appear especially deserving of notice. The samples of starch manufactured by C. C. PRINS, of Wormerveer (12, p. 1143), are excellent, and the Jury accordingly awarded to them a Prize Medal.

The specimens of potato starch, and dextrine prepared from it, exhibited by SCHÖNEVELD and WESTERBAAN, of Gouda (13, p. 1143), were also judged superior, and a Prize Medal was accordingly awarded for them.

A capital sample of potato starch is likewise shown by VISSER, NOLLET, and Co., of Scheidam (15, p. 1143). This the Jury deemed worthy of Honourable Mention.

Amongst the small series of the natural productions of the Island of St. Domingo, exhibited by Sir R. SCHOMBURGK (see p. 71), is a sample of starch prepared there from a plant called "guayiga" (p. 1439), a species of *Zamia*, and which is stated to be abundant. This specimen the Jury deemed worthy of Honourable Mention.

Some good samples of starch are shown by D. G. MIRAT, of Salamanca (128, p. 1337).

Two specimens of starch in the Portuguese Department are found to merit notice, namely, the starch from Estremadura, exhibited by MM. HOLBECH (454, p. 1313), and the starch from Alemtejo, Evora (453, p. 1313): the Jury deemed both these deserving of Honourable Mention.

In the Russian collections, there is a good sample of potato starch exhibited by YURGHENSON, of Marieno, in the government and district of Novgorod (72, p. 1368); also a specimen of dextrine prepared from potato starch, in the district of Shatak, government of Tamboff, exhibited by the Prince V. VOLKONSKY (70, p. 1363); some samples of starch and dextrine, manufactured by VERDAN and Co., of Moscow (30, p. 1367); and some excellent wheat starch exhibited by C. ROTEMAN, of Alveval (71, p. 1368). The Jury deemed these, severally, deserving of Honourable Mention.

#### SECTION 2.—OIL SERIES.

Notwithstanding the great importance of oil, and the number of purposes to which it is applied in the arts and manufactures, comparatively few English exhibitors have contributed specimens, independent of those sent in illustration of the manufacture of candles, all of which, as already stated, have been referred to Class XXIX. This is certainly remarkable, when we remember the large quantities of oil annually imported, and the extensive use of it in the arts of candle and soap making, for burning in lamps, for diminishing friction in machinery of all kinds, and especially for locomotives;—in wool dressing, in the manufacture of paints and varnishes, as an article of food, for medical purposes, &c. Oils are generally divided into the fat or fixed oils, and the essential or volatile oils; the former class being again subdivided, into fixed greasy oils and drying oils; and, lastly, the fixed greasy oils are separated into those which are usually fluid at all ordinary temperatures, and those which are generally solid, the latter being called tallow, butter, or solid oils. The quality of any oil depends, in part, on the nature and goodness of the seed or nut from which it is expressed; but it is influenced far more by the process employed in its extraction; the value of the oil for many purposes depending on its purity, or the absence of foreign matter derived from the seed, and consequently being greatly affected by the conditions under which it is expressed, the mode in which the seed is crushed, the kind of press employed, and, above all, the temperature at which it is pressed.

Among the oils (of which there is a very great number), there are several which are admirably suited for various purposes, but which, nevertheless, on account of their price, depending, generally, on local circumstances, such as cost of freight, &c., are very little or not at all used by our manufacturers. The knowledge, however, that such oils may, at any time, be procured in large quantities, is of great practical value; because, not only is it possible that, by the introduction of improved machinery, or by increased facilities of conveyance, their price may be reduced; but the very existence of such substances tends to equalize the market value of those oils now generally employed—and should, at any time, accidental circumstances cause the price of the latter to advance, these substances would then be most advantageously introduced, and would probably, ere long, altogether supersede the oils in the place of which they had been originally imported. Thus the price of tallow is, to some extent, regulated and kept in check by that of palm and cocoanut oil; and should the value of the latter oils at any time rise, there are a number of other solid vegetable oils, equally good for all practical purposes, which with a very little trouble might be had in almost any quantity. There are, however, some special purposes in which oils are used, for which it would not be so easy to find good substitutes; such, for example, as the lubrication of fine machinery, and the operations of the wool-spinner. It is probable that, among the numerous little-known oils of tropical countries, there may be many as well suited for both of these purposes as those now generally employed; good specimens of new oils are, therefore, always of con-

siderable practical interest. Whilst, on the one hand, it is desirable to draw the attention of manufacturers and consumers to the numerous foreign and colonial oils not at present imported into this country,—it is at the same time also useful to point out how greatly the value of such oils depends on the care bestowed on their preparation, especially as regards cleanliness of the seed, and the exclusion of impurity of all sorts in the process of extracting the oil.

Of the six principal vegetable oils, namely, palm, cocoanut, castor, olive, linseed, and rape, the first four are imported in the state of oil, only; the two last chiefly as seed: the proportion in which they were imported in the year 1850, is shown in the following Table; and if to these quantities are added about a million and a half cwts. of tallow, and about 20,000 tons of whale oil and spermaceti, they will nearly represent the total quantity of oil imported into Great Britain.

|                        | Linseed. | Rape-seed. |
|------------------------|----------|------------|
|                        | Grs.     | Grs.       |
| From Russia            | 482,813  | 3,235      |
| Sweden                 | 870      | —          |
| Norway                 | 268      | —          |
| Denmark                | 37       | 3,092      |
| Prussia                | 87,273   | 645        |
| Hanse Towns            | 1,153    | 2,872      |
| Holland                | 7,734    | 201        |
| Naples                 | 1,476    | —          |
| Austrian Territories   | 40       | 2,480      |
| Greece                 | —        | 1,637      |
| Wallachia and Moldavia | 910      | 1,280      |
| Egypt                  | 17,517   | —          |
| East Indian Empire     | 26,142   | 13,126     |
| Miscellaneous          | 262      | 922        |
| Total                  | 626,495  | 29,490     |

The quantity of these four principal vegetable oils annually imported into Great Britain is shown by the following Table:—

|              | 1848          | 1849          | 1850          |
|--------------|---------------|---------------|---------------|
| Palm Oil     | 510,218 cwts. | 493,331 cwts. | 448,589 cwts. |
| Cocoanut Oil | 85,463 "      | 64,452 "      | 98,040 "      |

An interesting and valuable series of specimens of cotton seed, and of the oil and cake obtained from it, after the expression of the oil, is shown by R. BROWN, of Edinburgh (Class III., 68, p. 204). The oil of cotton seed has been made in small quantities for a considerable number of years. In 1785, the Society for the Encouragement of Arts and Commerce offered a prize for its manufacture, on a large scale; but it does not

have been then taken up extensively, probably in consequence of the difficulty of purifying it. It has, however, been extracted, for some time, in Egypt, America, and India. Of late years this oil has attracted a good deal of attention; and efforts have been devised of purifying it, and removing the dark colour which it possesses in the raw state. Very large quantities of cotton seed are destroyed every year; as far more seed is produced than is required for the next year's crop: this, for the most part, has hitherto been thrown away as useless, or used as manure; its value is now, however, so far acknowledged, that in some places it is collected and exported for the manufacture of oil and oil-cake. The oil seems to be well worthy of attention. The Jury consider the specimens shown by Mr. DUAN, valuable and instructive, especially as they are accompanied by much useful information, and they therefore awarded to him a Prize Medal.

Some very good samples of rape, olive, and almond oil, are exhibited by Messrs. W. BROTHERTON and Co. (23, p. 196\*), including specimens of rape-seed, both of English and foreign growth, in its natural state, and as prepared for pressing. The exhibitor has found good rape oil to be better suited than any other oil, for the lubrication of machinery, when properly purified from the mucilage, &c., which it contains in the raw state. Rape oil is now used, extensively, for locomotives, for marine engines, and also for burning in lamps. It is stated that a locomotive consumes between 90 and 100 gallons of oil yearly; and the annual consumption of oil by the London and North Western Railway for this purpose alone is more than 40,000 gallons. Mr. Brotherton finds, that good English-grown rape yields oil of superior quality to any foreign seed which he has tried; and he consequently recommends its cultivation to agriculturists: he states that an acre of land yields nearly five quarters of seed, worth at present 50s. per quarter. The inferiority of the oil obtained from Indian or colonial seed, probably depends on the want of sufficient care being paid to the purity and cleanliness of the seed itself, and not on any real deficiency in the oil. The Jury deemed these samples worthy of Honourable Mention.

Specimens of purified oil, employed for lubricating machinery, and in perfumery, are shown by F. HILLAS (28, p. 197\*). The oils are remarkably well purified, nearly colourless, and apparently devoid of all impurity; the Jury, therefore, awarded a Prize Medal.

Specimens of essential oils, including sweet oil of turpentine, are exhibited by RARKER and Co. (62, p. 199\*).

Refined oil, prepared for the use of watch and clock makers; and suitable for lubricating delicate machinery, is shown by W. A. BARREY (Class II., 80; p. 196\*).

Good samples of linseed and rape oils are contributed by M'CLAGHY and Sons (Class III., 132, p. 208).

Fine specimens of various volatile oils, especially the oil of cinnamon leaf, are included in the collection of the LONDON DRUG TRADE (Class II., 117); and a good sample of English attar of roses is exhibited by J. BELL (Class II., 116, p. 199\*).

Specimens of clarified oil for machinery, and for burning in lamps, are contributed by W. A. ROSE (Class IV., 27, p. 197\*).

Samples of vegetable oils are shown by T. PETERSON (Class III., 66, p. 204).

A good specimen of bleached linseed oil, for the manufacture of varnish, is exhibited by H. PENNEY (Class IV., 64, p. 199\*).

In the collection of ENGLISH'S PATENT CAMPHINE COMPANY (Class IV., 61, p. 199\*), already alluded to, there is a number of samples of new and refined oils: these are valuable because they are accompanied by samples of the seeds from which they are extracted. The Jury deemed these specimens worthy of Honourable Mention.

In the extensive collection of LIVERPOOL IMPORTS, there is a valuable series of oils, including among the volatile oils,—

- |                |                  |                 |
|----------------|------------------|-----------------|
| 1. Aniseed.    | 7. Citronella.   | 13. Nutmegs.    |

The collection of oils exhibited by the HONOURABLE EAST INDIA COMPANY is very extensive, and contains a large number of highly interesting specimens; it constitutes, in fact, one of the most important divisions of the very valuable series of Indian raw produce which they exhibit.

Among the volatile oils must be particularly specified the attars of roses contributed by H. H. the RAJAH OF JEYPORE, H. H. the RAJAH OF KOTAH, and H. H. the RAJAH OF KISHINGOUR in the Rajpootana states; for these the Jury severally awarded Prize Medals. Very superior attar of roses and rose-water are contributed by Messrs. GODFREY, of Ghazepore (p. 878) for these, also, the Jury awarded a Prize Medal.

Besides these species of attar, or oil of roses, a number of other volatile oils are exhibited, many of which are very good, and also a series of artificial attars, or mixtures of various highly-scented volatile oils, with fixed oils, obtained in the manner sometimes adopted in pre-

paring spurious attar of roses. Oil of aloes wood is contributed from Nepal, Rajpootana, and Ghazepore; and oil of saffron by H. H. the RAJAH OF KOTAH (p. 878), from the Rajpootana states.

Several good specimens of the attar of keora, the odorous principle of the fragrant yellow flowers of the screw pine, or *Pandanus odoratissimus*, are contributed by H. H. the RAJAH OF KOTAH and others (p. 876). Some excellent attars prepared from various flowers are also sent by a native perfumer at Benares; the samples of Jasmine attar, *Jasminum grandiflorum* and *J. sambac*; the knus-knus attar, obtained from the *Andropogon nigraticornis*, and the attars of Chumeylee, Beyle, Begla, and Moteys, are especially good; and were deemed worthy of Honourable Mention.

Grass-seed oil, obtained from the *Andropogon sohananthus* (or *Calamus aromaticus*), accompanied by a portion of the seed, and some of the dried plant itself, are contributed from Malwa by R. M. HAMILTON, resident at

Indore (p. 878): these were deemed worthy of Honourable Mention.

Specimens of Sirri, or lemon-grass oil, *Andropogon schenanthus*? are likewise forwarded from Sumatra. The fragrant volatile oil obtained from various species of *andropogon* is now extensively imported into England for the use of perfumers; it is brought from Travancore under the name of oil of geranium.

A series of attars from different plants is sent from Moluccas; but unaccompanied by any information: they are labelled:—

- |              |              |              |
|--------------|--------------|--------------|
| 1. Kodjamas. | 4. Pulasare. | 7. Tjindor.  |
| 2. Ananas.   | 5. Goelang.  | 8. Abier.    |
| 3. Yailang.  | 6. Tjoelang. | 9. Rampsing. |

A good sample of oil of cloves is exhibited by T. KEY of Madras (p. 878); some excellent oils of kayn-pateh, or cajeputi, and macassar, from the Celebes, are shown by SYED OMAR (p. 878); and a fine sample of sandal-wood oil, obtained from *Santalum album*, is contributed from Canara.

Good specimens of sandal-wood oil are also contributed from Mangalore and from Coorg.

In connexion with the volatile oils, an interesting specimen of the Barus (Borneo) camphor may be mentioned. It is obtained from the *Dryobalanops camphora*, in Sumatra, and is chiefly exported to China, where it is very highly valued, selling at nearly one hundred times the price of common camphor. It is said that the Chinese employ it to mix with, and improve the flavour of the ordinary camphor of commerce: this, however, is highly improbable; it is most likely valued for its supposed medicinal qualities. Specimens are contributed by the SINGAPORE COMMITTEE (p. 878), and were deemed worthy of Honourable Mention.

The collection of fixed fat oils is even still more numerous, and includes contributions from various exhibitors, some of whom send specimens of similar oils, but obtained from different localities. The Jury awarded a Prize Medal to Messrs. SAINTE and Co., of Cossipore, near Calcutta (pp. 878, 879), for their samples of refined cocoa-nut oil. They also awarded Prize Medals to H. H. the MAHARAJAH RAO SCINDIA, of Gwalior, H. H. the RAJAH of VIZIANAGRAM, Lieut.-Colonel TULLOCH, the Commissary-General of Madras, Mr. T. BISHOP, of Tanjore, and Professor J. KEY, of Madras, for specimens of the fat oils of India. The following are the most important of the oils included in these collections, and in the general series of the HONOURABLE EAST INDIA COMPANY:—

1. Sesamum oil. Three varieties of til, or *Sesamum orientale*, are extensively cultivated throughout India for the sake of the fine oil expressed from their seeds; these are the "suffed-til," the white-seeded variety; "kala-til," the parti-coloured variety; and "tillee," or black til; it is from the latter that the sesamum, or "gingelly" oil of commerce, is obtained. Sesamum seed contains about 45 per cent. of oil; good samples of this oil are contributed from Vizianagram, Ganjam, Hyderabad, Tanjore, the district of Moorshedabad, and Gwalior. The samples exhibited by H. H. the RAJAH of VIZIANAGRAM (p. 879) are particularly fine; the value of the Novvoooloo Pyaroor, or gingelly seed, is stated to be about 4s. per ton in the N. Circars. The samples shown by the COMMISSARY-GENERAL OF MADRAS, and by Professor KEY, are also excellent.

2. Ram-til oil. An oil resembling that of the sesamum, obtained from the seed of the *Gnizotia oleifera*, a plant introduced from Abyssinia, and common in Bengal. Specimens of this oil from Bombay, Vizagapatam, and Ganjam, are shown. From the latter place there is a sample of the oil obtained from another variety of *Gnizotia*, the Valua mum, or *Gnizotia abyssinica*, which is very similar to, if not identical with, the *G. oleifera*. The ram-til, or valsaloo seeds, yield about 34 per cent. of oil; in Vizianagram the oil is used exclusively for burning; its value there is stated to be about 10d. a gallon. The samples shown are of a dark-brown colour, and evidently impure.

3. Ground-nut oil, obtained from the seed of the Bhoemoong (Moong phullees), or *Arachis hypogaea*, a plant

pretty extensively cultivated in various parts of India; the seeds contain about 44 per cent. of a clear pale-yellow oil, which is largely used as food, and for lamps. Samples of this oil are sent from Bombay by T. KEY; from Malwa, and from Malacca. Two varieties of the ground-nut, or Katjang tanah, are cultivated in Malacca, the white seed, and the brown seed; specimens of these, as well as of the Katchary, or Katjang oil from Malacca, and also Java, are exhibited. This plant is much cultivated in Java, in the vicinity of sugar plantations, and the oil-cake is used as manure.

4. Oil of Kosumba, or Koom-oil, a pale brownish-yellow oil, obtained from the seeds of *Carthamus tinctorius*, which contain about 28 per cent. A good sample of this oil, as well as of the carthamus seeds, is sent from Bombay.

5. Shersha, or oil of mustard. Excellent oil is expressed in various parts of India from the seeds of different species of *Sinapis*, especially from the *Sinapis* commonly called black mustard, &c. Specimens of mustard oil from *Sinapis toria*, from Meerut; from black mustard, from Tanjore; from *Sinapis glauca*, from the Chota Nagpore division; and mustard seed from Ghazepore, and various localities, are shown.

6. Castor oil, obtained from the seeds of *Ricinus communis*. Good specimens of this are exhibited from Tanjore, contributed by Mr. BISHOP, from Beerbhoom, Bellary, Madras, Tinnevely, and Java (p. 879). The common jungle lamp oil, of which a sample is also shown from Tanjore by T. BISHOP, is a variety of castor oil.

7. Poppy oil, obtained from the seeds of *Papaver somniferum*. Good specimens are sent from Tanjore, by Mr. BISHOP, from Calcutta, and from Bombay (p. 879). The sample from Tanjore is almost colourless, and deserves special commendation.

8. Croton oil. Expressed from the seeds of the Napaula, or *Croton* sp. nearly allied to *C. tiglium*; samples of this are shown from Vizianagram and Ganjam; a very good specimen is exhibited by J. KEY (p. 879).

9. Poop-seed oil. Hoenda, oondee, or Pinnacottay oil. The seeds of the Poonay tree, the *Calophyllum inophyllum*, or Alexandrian laurel, contain a large quantity of oil, which constitutes nearly 60 per cent. of their weight. As commonly prepared, it has a dark-greenish colour, derived from the colouring matter of the seed. It is perfectly fluid at common temperatures; but begins to gelatinize when cooled below 50°. Specimens of this oil are exhibited from Palamcottah, from Bombay, from Madras, and Tinnevely, Malwa, and by T. BISHOP, from Tanjore (p. 879).

10. Limbolee oil, obtained from the seeds of *Bergera hoenigii*; it is of a rich-yellow colour, perfectly clear and transparent; from Bombay.

11. Napala oil, procured from the seeds of the Cantamunika, Banga cherinda, or *Jatropha curcas*; the angular-leaved physic nut. A beautiful pale-yellow oil, used by the natives in medicine, and as a lamp-oil. Good specimens are contributed by the COMMISSARY-GENERAL OF MADRAS; from Vizianagram and Ganjam; an inferior sample, called Bhoga bhirinda, is sent from Beerbhoom.

12. Linseed oil—tisseel til. Contributed, together with samples of linseed, from Moorshedabad, Bombay, Patna.

13. Mulu unny oil, expressed from the Brumadundoo unny, the seed of the *Argemone mexicana*, an oil used in various parts of India for lamps, and in medicine.

14. Cheerojee oil, obtained from the Tumbi, pallum, the fruit of the *Chironia sapida*, or *Buchanania latifolia*.

15. Kauru nung, or Kurrunj oil, procured from the seeds of the *Pongamia glabra*, or *Galedupa arborea*; a honey-brown and almost tasteless oil, fluid at common temperatures, but gelatinizing at 55°. Specimens of the oil are contributed from Vizagapatam and Bannah.

16. Mooneela oil; Varoo sangaloo Nona, obtained from the seed of *Dalichos biflora*? exhibited by T. BISHOP (p. 879), from Tanjore; a pale-yellow clear oil.

17. Chu apple oil; Moontha munnerey noonas; expressed from the seeds of the Kapa mava, or *Adesodium occidentale*; contributed by T. BISHOP (p. 879), from Tanjore.

18. Poonga or Poon (?) oil, from the seeds of *Capindus*

*emarginatus*? contributed from Tanjore by T. BISHOP and W. B. HORSLEY (p. 879), from Palamcottah. Mr. Horsley is Honourably Mentioned.

19. Badam noona, almond oil; *Terminalia* sp. from Tanjore.

20. Coodivetty Poondoo oil.—*Allium* sp. from Tanjore.

21. Malkamnee oil, *Celastrus paniculatus*? from Madras.

22. Nahor nut oil; contributed by Major HANNAY (pp. 879, 880).

23. Moringa oil; *Moringa pterygosperma*.

24. Shammanatie oil; contributed by W. B. HORSLEY, from Palamcottah (pp. 879, 880).

25. Hingun or Hingota.—*Balanites Egyptiaca*, from Bombay.

26. Dessy akuroot, obtained from *Aleurites triloba*, the country walnut, from Bombay.

27. Saal tree seed oil.—*Shorea robusta*.

28. Chendeorookoo oil, from Madura and Tinnevely.

29. Coorookoo oil, contributed by the COMMISSARY-GENERAL OF MADRAS, from Madura and Tinnevely, (pp. 879, 880).

30. Koodree oil.

31. The collection of oils also includes some very interesting vegetable butters and tallows, some of which are almost entirely unknown in Europe. The samples of cocoa-nut oil from Messrs. SAINTE (p. 880), of Cossipore, have been already alluded to; besides these, very good samples are contributed by the COMMISSARY-GENERAL OF MADRAS, T. BISHOP (p. 880), from Tanjore; and by other exhibitors from Malabar, Madura, Tinnevely, and Sarawak in Borneo.

Three species of *Bassia*, indigenous to India, yield solid oils; and are remarkable for the fact, that they supply at the same time, saccharine matter, spirit, and oil, fit for both food and burning in lamps.

32. Iipa oil, Eleopei unny, expressed from the seed of the illupie tree, or *Bassia longifolia*, a tree abundant in the Madras Presidency, and the southern parts of Hindostan generally. The oil is white and solid at common temperatures, fusing at from 70° to 80°. It may be advantageously employed in the manufacture of both candles and soap. Specimens of this oil are contributed by the COMMISSARY-GENERAL OF MADRAS (p. 880), and J. KEY (p. 880), and from Madura and Tinnevely.

33. Epie oil, or mahowa seed oil; Ippa noona, obtained from the seeds of the mahower, or *Bassia latifolia*, which is common in most parts of the Bengal Presidency. The oil is good deal resembles that of the illupie tree, and may be used for similar purposes. It is solid at common temperatures, and begins to melt at about 70°. The specimens of this oil shown by T. CORLESTONE (p. 880), from Mangalore, were deemed worthy of Honourable Mention; it is also sent from Canara.

34. Phoolwa, or vegetable butter, expressed from the seed of the choorie, or *Bassia butyracea*, a tree, which though far less generally abundant than the *B. longifolia* and *B. latifolia*, is common in certain of the hill districts, especially in the eastern parts of Kemaon: in the province of Dotee, it is so abundant, that the oil is cheaper than ghee, or butter, and is used to adulterate it; it is likewise commonly burnt in lamps, for which purpose it is preferred to cocoa-nut oil. It is a white solid fat, fusible at about 120°, and exhibits very little tendency to become rancid when kept. Specimens of this oil, as prepared for food, are shown from Kemaon.

35. Miniak Tenkawung, a solid oil of a pale-greenish colour, a good deal resembling the oils of the *Bassia* in character, though rather more hard, and approaching more in properties to myrtle wax. This is probably the produce of the tallow tree of Java, described by Sir S. Raffles under the name of minyak kawon; and by Crawford, as being very common in the western countries of the Archipelago, where it is called "kawan."

Mr. Crawford supposes it to be produced by a species of *Bassia*. According to Mr. Low, there are several varieties of solid oil commonly used in the islands of the Archipelago, and obtained from the seeds of different species of *Dipterocarpus*. It is a hard yellowish-green coloured substance, brittle, and fusible at about 93°, and when fused, solidifies at about 85°. Specimens are contributed by the

SINGAPORE LOCAL COMMITTEE. It is very easily bleached; indeed, by mere exposure to air and light, it becomes perfectly white; if not too costly, it promises to be a valuable oil.

36. Piney tallow, obtained from the fruit of the peynie marum, paenoe, dammar, or doop tree, *Pateria indica*, a large and quick-growing tree, abundant in Malabar and Canara. A white, solid oil, fusible at a temperature of 97°. This oil makes excellent candles, especially when saponified and distilled in the manner now adopted with palm oil, &c.; it has one great advantage over cocoa-nut oil, that the candles made of it do not give out any suffocating acrid vapours when extinguished, as those made with the latter oil do. Samples are shown by T. CORLESTONE, from Mangalore (p. 879), and from Malabar and Canara.

37. Cocum oil, or kokum butter, obtained from the seeds of a kind of mangosteen, *Garcinia purpurea*, used in various parts of the peninsula to adulterate ghee or butter, and said to be exported to England for the purpose of mixing with bears' grease in the manufacture of pomatum. It is a white, or pale-greenish yellow, solid oil, brittle, or rather friable, having a faint, but not unpleasant smell, melting at about 95° and when cooled after fusion, remaining liquid to 75°. Samples of this oil are contributed from Bombay.

38. Kali ziri, or khatzum, obtained from the seed of the coat siragum, or buckchie, *Vernonia anthelmintica*, a plant common in Guzerat and the Concan Ghats; there is, however, some uncertainty as to the plant from which this excellent oil is obtained, the label on one of the specimens describing it as the produce of the *Salvadora persica*. It is a bright green, solid oil, having a consistence intermediate between that of tallow and wax, fusible at about 95°, and easily bleached; it has a peculiar and somewhat aromatic odour. Samples of this oil are sent from Bombay.

39. Neem oil, Vaypum unny, obtained from the ripe fruit of the Nim, Arioht, Vaypum, or Margosa tree, *Melia azadirachta*; a large and beautiful tree, by no means uncommon. The oil is pale yellow, and is solid at ordinary temperatures. Specimens are contributed by the COMMISSARY-GENERAL OF MADRAS (pp. 879, 880); from Bellary; by T. BISHOP (pp. 878, 880), from Tanjore; and by J. KEY (pp. 879, 880).

40. Gutta podah; from Biliton; a sort of wax, of a bright-green colour, which might probably be advantageously used like the other kinds of vegetable wax, in the manufacture of candles, associated with the more easily fusible fatty substances.

Good specimens of lemon-grass oil from Galle, are shown by G. WINTER, (pp. 879, 880); and samples of cinnamon and citron oils, and the oil of the Bengal quince, or *Egle marmelos*, from Ceylon, are also exhibited; the cinnamon oil from Messrs. PARLETT, O'HALLORAN, and Co. (pp. 879, 880), of Colombo, is very good. There are likewise some excellent specimens of cocoa-nut oil, intended to illustrate the process of its manufacture, consisting of the copperah, or dried nut, the expressed oil, and the stearine and stearine purified, and obtained separately; for this valuable series a Prize Medal was awarded.

A valuable series of eighteen samples of Ceylon oils is contributed by T. A. PIERIS (p. 938)—see also EAST INDIA COLLECTION (pp. 878, 879)—of Kandy, the names of these are—

|                |                  |                  |
|----------------|------------------|------------------|
| 1. Castor.     | 7. Kekuna.       | 13. Koola.       |
| 2. Rape-seed.  | 8. Makula.       | 14. Balegorande. |
| 3. Gingelly.   | 9. Kadlic.       | 15. Naarawyene.  |
| 4. Branjematy. | 10. Kellocoraja. | 16. Mahakoomara. |
| 5. Siddhartha. | 11. Rattas.      | 17. Dummelle.    |
| 6. Kolestesma. | 12. Dorens.      | 18. Chandatada.  |

The oils, Nos. 5 and 7, are nearly colourless. The value of this collection would have been considerably increased, had the specimens been accompanied by any practical information. The Jury awarded a Prize Medal for these oils, together with the series of gums and resins shown by the same exhibitor.

Some fine specimens of myrtle or berry wax, from the

Cape of Good Hope, are exhibited by J. LAWRENCE, of Worcester district (45, p. 950). This is an excellent material for the manufacture of candles, when employed in conjunction with other solid fats. The Jury awarded a Prize Medal for these specimens.

From Western Africa an interesting collection of oils and oil seeds is contributed by WARWICK WESTON (1, p. 953), consisting of Shea butter, or galam butter, obtained from the fruit of the Micadenia, or *Bassia Parkii*, a tree closely resembling the *Bussia latifolia*, and other species indigenous to Hindostan. According to Park, the tree is abundant in Bambara; the oil is solid, of a greyish-white colour, and fuses at 97°. Specimens are also shown of Bayne seed and Ground-nut (*Arachis hypogaea*), and of the oil expressed from them; and likewise of palm oil, and palm kernel oil, the former excellent. The Jury awarded a Prize Medal for these specimens.

A specimen of the Shea butter is also exhibited by Dr. McWILLIAM, from Egga, on the river Niger (5A, p. 953, 954), which was deemed worthy of Honourable Mention.

A good specimen of myrtle or candle berry wax, accompanied by candles made from it in the crude unbleached state, and a dried branch of the plant itself, bearing leaves and fruit from New Brunswick (29, p. 970), are exhibited by J. CHALMERS; these were deemed worthy of Honourable Mention.

Good samples of cocoa-nut oil are contributed by the ROYAL SOCIETY OF NATURAL HISTORY OF THE MAURITIUS, (4, p. 970), and by Mr. MILLON, likewise from the Mauritius (6, p. 956).

Specimens of laurel oil, from the River Poomeroon, Essequibo, and crab or carapa oil, from the Essequibo river, in British Guiana, are exhibited by J. S. STRICKLAND (52, 53, p. 980). The latter is a sort of vegetable butter, being sometimes solid, and sometimes half fluid, which is obtained from the seed of the carapa or yandiroba, *Carapa guianensis*, or *Xylocarpus carapa*, a large tree, abundant in the forests of Guiana and Acadia. It is said to turn rancid very soon when exposed to the air, but this is probably caused by the presence of impurities arising from the crude and imperfect mode in which it is prepared by the natives, who boil the kernels, leave them in a heap for a few days, then skin them, and lastly reduce them into a paste in a wooden mortar, which is then spread on an inclined board, and exposed to the heat of the sun, so that the oil may melt and gradually trickle down into a vessel placed below to receive it. The Jury awarded a Prize Medal for this specimen.

Another sample of crab or carapa oil is also shown in the collection of Trinidad, raw produce, exhibited by LORD HARRIS (see p. 71; p. 973), as well as a portion of cocoa-nut oil, of which a considerable quantity is obtained from that island, chiefly on the eastern coast; and a specimen of cacao butter, obtained from the seeds of the *Theobroma cacao*, a well-known white solid fat, fusible at about 120°.

Some excellent olive oil, the produce of New South Wales, is exhibited by R. HALLET and SONS (5, p. 991). Independent of its interest as coming from a colony, this oil deserves notice for its clearness, colour, and flavour; it was deemed worthy of Honourable Mention.

A good sample of olive oil, from South Australia, is also exhibited by the COLONIZATION ASSURANCE CORPORATION, in their series of Western Australian raw produce (see p. 71). They also show some sandal-wood nut oil and tar from Guildford; some distilled oil of the *Leptospermum*, which it is stated may be obtained in any quantity; and a similar oil, produced by distillation from the *Eucalyptus piperita*, a powerful solvent of caoutchouc, evidently very similar, if not altogether identical, with the oil of Cajuput. The characters of these two oils are very similar, and without some care, it is difficult to distinguish them from one another by the odour; the leptospermum oil has a slight tinge of yellow, its specific gravity is 0.9035; the eucalyptus oil is colourless, and has a density of 0.9145. It is probable that these oils might be used with great advantage in the manufacture of varnish, they readily dissolve copal, and when its solution is spread over any surface, the oil soon evaporates, and leaves a hard brilliant and uniform coating of the resin; these oils are especially worthy of attention.

A remarkably good sample of oil of peppermint is shown by H. G. and L. B. HOTCHKISS, of Lyons, New York (156, pp. 1446, 1447); for this the Jury awarded a Prize Medal.

An interesting specimen of maize, or Indian corn oil, is contributed by B. B. KIRKMAN, of Greenbush, New York (84, p. 1439).

An excellent series of samples of Austrian linseed and linseed oil is exhibited by A. STEINBOCK, of St. Georgia, near Manthausen (103, p. 1013), consisting of Upper Austrian and Moravian seed, together with oil of first and second quality, both raw and prepared for drying, extracted from both sorts of seed. For the superior quality of these oils the Jury awarded a Prize Medal.

Some good Hungarian rape oil, in its crude state, and likewise refined, is shown by C. T. MALVIEUX, of Pesth (102, p. 1013); this was deemed worthy of Honourable Mention.

The chief oils shown in the Belgian collection are of animal origin, but there are also several good vegetable oils. L. E. BISS, of Anderlecht, near Brussels (87, p. 1154), exhibits remarkably fine clear samples of refined vegetable oil: for these the Jury awarded a Prize Medal. Good linseed oil, prepared for the use of painters, and purified colza oil, are contributed by F. VANDERSTRAETEN, of Brussels (84, p. 1154). L. CLAUDE, of Brussels (85, p. 1154), shows extra-refined pale rape, purified for burning in lamps, as a substitute for sperm; and DENBAUM-DI LACROIX, of Courtrai (92, p. 1154), exhibits some good colza oil, both raw and purified. These three the Jury severally deemed deserving of Honourable Mention.

Some vegetable wax from China, is contributed by HER MAJESTY'S CONSUL, at Shanghai (p. 1418); this substance, from its brilliant, melting point, and other physical characters, has of late attracted a good deal of attention; it is admirably adapted as a material for the manufacture of candles. The Jury, therefore, deemed it worthy of Honourable Mention. A remarkable vegetable wax from Japan is also shown.

Samples of castor oil, lettuce oil, safflower oil, turpentine seed oil, oil of melon or angella, linseed oil, and oil of cotton seed, are shown in the Egyptian collection; the latter is the most remarkable: the series of Egyptian oils was deemed worthy of Special Mention.

Cotton-seed oil in the raw state, and the same refined and bleached by a patent process, are exhibited by DE GÉMINY, of Marseille, where the manufacture of this oil from Egyptian seed, and its purification, are now carried on to a considerable extent (1613, p. 1254). For this specimen the Jury awarded a Prize Medal.

Specimens of various volatile oils are shown by HUGUES, junior, of Grasse, Var (881, p. 1222). These oils are prepared by a direct process of distillation, discovered by the exhibitor about a year since, and by means of which the oil is at once obtained in a state of purity, so that no subsequent rectification is required. By this process, volatile oils are manufactured for the use of perfumers, in a highly-economical manner, and a superior product is obtained both in regard to colour, and likewise in respect to delicacy of odour. The Jury awarded a Prize Medal for these oils.

Specimens of volatile oils prepared for the use of perfumers, are also exhibited by C. D. MARO, of Grasse, Var (1356, p. 1241). For these likewise the Jury awarded a Prize Medal.

Samples of very superior bleached oil, for the use of painters and varnish-makers, are contributed by E. B. MARO, of Paris (806, p. 1231). The Jury awarded a Prize Medal for these specimens.

Some very interesting specimens of artificial volatile oils, and perfumed essences, are shown by M. A. C. COLLAR, of Paris (801, p. 1219). The Jury awarded a Prize Medal for these.

Some very good bleached oil, prepared for the use of painters, is shown by DE RUOLS, of Paris, (1466, p. 1246); this was deemed worthy of Honourable Mention. A very fine cake of purified camphor is exhibited by W. CONRAD, of Paris (1156, p. 1233); this was deemed worthy of Honourable Mention.

Purified oil, prepared for the use of watchmakers, for

diminishing friction in machinery, and for fire-arms, &c., is shown by F. JOLLY, of Mar, Loire-et-Cher (376, p. 1192).

Oil for lamps and machinery of various sorts is also exhibited by M. MORRAU (325, p. 1192).

Purified linseed oil, and oil boiled with oxide of lead, are shown by RENAULT, of Bordeaux.

A number of good samples of oils are shown by various exhibitors, in the very interesting collection of the raw produce of Algeria, contributed by the MINISTER OF WAR (see p. 69). In particular, the series shown by CURTET, junior, of Bab-el-Oned (22, p. 1261), deserves notice; it consists of good specimens of the oils of linseed, sunflower, cameline, sesamum, mardia, castor, olive, colza, mustard, and cotton seed, together with the seeds from which they are expressed. The Jury awarded a Prize Medal for this series.

A good collection of oils is also shown by H. J. MENCOURN, of Cheragas (37, p. 1261), including olive oil of 1850, and a series of essential oils, for the use of perfumers, namely—

- |               |               |                  |
|---------------|---------------|------------------|
| 1. Bigararde. | 6. Rose.      | 11. Petit grain. |
| 2. Citrine.   | 7. Geranium.  | 12. Neroli.      |
| 3. Melaroso.  | 8. Jasmin.    | 13. Cedrat.      |
| 4. Absinthe.  | 9. Citron.    | 14. Bergamotte.  |
| 5. Myrthe.    | 10. Portugal. |                  |

For this also the Jury awarded a Prize Medal.

Fine samples of olive oil, prepared in 1850, are likewise exhibited by J. HORDE, of Philipville, Constantine (9, p. 1259), and E. F. MAFFRE, of Bouigne, Constantine (35, p. 1261); these were each deemed worthy of Honourable Mention.

A series of volatile oils, essences, are also contributed by P. SIMONNET (51, p. 1262), consisting of—

- |               |                   |               |
|---------------|-------------------|---------------|
| 1. Sauge.     | 5. Citron zest.   | 8. Bigararde. |
| 2. Absinthe.  | 6. Melaroso.      | 9. Nesci.     |
| 3. Verveine.  | 7. Portugalzeste. | 10. Neroli.   |
| 4. Citronine. |                   |               |

Pine-needle oil, a volatile liquid obtained during the desiccation of pine leaves, or needles, in preparing a fibrous material for the use of upholsterers (see p. 82; p. 1054), is exhibited by C. G. FARIAN, of Humboldtaw, near Breslau (95); this was deemed worthy of Honourable Mention.

Purified oil, intended for the use of watchmakers, is exhibited by J. L. F. SCHRAMM, of Dessau (806, p. 1094).

Fair samples of rape-seed, and rape oil, from Holland, are shown by A. DE HAAN, of Rotterdam (9, p. 1143); these were considered deserving of Honourable Mention.

A large number of exhibitors of olive and other oils is found in the Portuguese collections. Among these may be specified fine samples of olive oil from J. L. DE CASTELOS MEXEIRO (460-1, p. 1313); from ALMIDIA PRAENCA (462-3-4, p. 1313); from DR. MAUDO (465-6, p. 1313); from J. LANCHER (467-8, p. 1313); from the COUNT DE FARROHO (469-70, p. 1343); from J. B. PINTO (471-2, p. 1313); from ALMEIDA SILVA, and Co. (473-4-5-6-7, and 480, p. 1313); from J. D'ALBUQUERQUE MELO (478-9, p. 1313); from the M. ROLIG DE FICALHO (481-2, p. 1313); and from the COUNT DE LINHARES (483-4, p. 1313); each of these was deemed worthy of Honourable Mention.

Excellent specimens of several volatile oils, including those of lavender, juniper, rosemary, and lemon, are sent by F. M. C. LRAAL, (497-500, p. 1313); for these the Jury awarded a Prize Medal.

Very good samples of palm and ground-nut (*avachia*) oils, from Angola, are exhibited by F. R. BATALHA; (495A, p. 1343); these were deemed deserving of Honourable Mention. Fair samples also of castor, linseed, and almond oils are likewise shown by V. BURNAY (493, p. 1313), from Pernambuco.

From the Linnæan Society's Institute, in the government of St. Petersburg, a series of Castoreo Siles (83, p. 1359), are samples of the empyreumatic volatile oil, obtained by the destructive distillation of birch bark; this substance is employed in the preparation of Russia leather, and gives it that peculiar and agreeable odour, which helps

to preserve it from the attacks of insects. This oil has a dark-brown or almost black colour, is somewhat thick, and has a specific gravity of 0.939. Its odour is strong; disagreeable, and empyreumatic; when poured upon paper, it forms a brown greasy stain, which, however, soon dries, and after a short time, when the empyreumatic odour is dissipated, there remains only the peculiar and agreeable scent which belongs to Russia leather. The Jury awarded a Prize Medal for these specimens.

Fine samples of walnut, linseed, colsead, and castor oils, are exhibited by GIRARDI BROTHERS, of Turin, (5, p. 1302). Good olive oil is also shown by the CHEVALIER MANCU SIMONE, of Sassari (15, p. 1303); and by S. MAMINA, of Nuoro (31, p. 1303); and some good linseed oil is contributed by J. CALVI, of Genoa (22, p. 1303). These were severally deemed deserving of Honourable Mention.

In the Spanish collections, an excellent sample of the essential oil of lemon is shown by J. CANALAS, of Malaga, (242A, p. 1344). For this the Jury awarded a Prize Medal. The manufacture of olive oil in Spain has undergone very considerable improvement during the last few years; in particular, the process for expressing the oil has been rendered more rapid and effectual by the introduction of the hydraulic press, and thus the injurious consequences which resulted from the partial fermentation of the fruit are avoided.

Fine samples are contributed by the Province of Almeria (164, p. 1339); from Alburquerque, by C. S. MONTENOS, of Badajoz (167, p. 1339); from Almadovar del Rio, by the Province of Cordova (165, p. 1339), being the produce of the wild olive; from the village of Niguelas, by J. ZAYAS, of Granada (168, p. 1339); from Santa Fe, by A. DIEZ DE RIBERA, of Granada (172, p. 1339); by M. FLEANDER, of Malaga (169, p. 1339); and by the Province of Seville (171, p. 1339). These were severally deemed worthy of Honourable Mention.

Samples of olive oil are likewise exhibited by the AGRICULTURAL BOARD OF VALENCIA, from D. V. TORTOSA, and D. J. CAIRASCOSA (173, p. 1339); by the AGRICULTURAL BOARD OF CORUÑA; and by the GOVERNMENT OF SARRAGOSA (174, p. 1339). A specimen of linseed oil, from Lorea, is contributed by D. —, of Murcia (170, p. 1339); and nut oil from Oviedo, by D. S. ALVAREZ CALLEJA (166, p. 1339).

A cake of hard vegetable wax, obtained from a plant indigenous to the northern parts of St. Domingo, is contributed by Sir R. SCHOMBURGK amongst the other raw produce of that island. It is not suited for the manufacture of candles alone, but, like the berry wax of the Cape of Good Hope, serves very well to mix with other fatty substances (see p. 83; p. 1429).

A few samples of oils are contributed from Tunis, including, besides some of the common fixed oils, samples of several of the volatile oils used in perfumery, especially the oil or attar of roses, and of jasmine, together with a few mixed essences, such as those of quince, orange, benzoin, aloes, &c.

Some good specimens of linseed oil, and of rape oil, both refined and unrefined, are shown by JOSEPH OWEN, of Copenhagen (44, p. 1359); these were deemed worthy of Honourable Mention.

The Turkish collection of raw produce includes a numerous and interesting series of oils, both fixed and volatile, from various localities, the former include the following (see p. 69)—

- |               |   |   |   |                 |
|---------------|---|---|---|-----------------|
| 1. Almond     | - | - | - | Damascus.       |
| 2. Castor     | - | - | - | Asia Minor.     |
| 3. Laurel     | - | - | - | Djendgiva.      |
| 4. Linseed    | - | - | - | Constantinople. |
| 5. Olive      | - | - | - | Damascus.       |
| 6. "          | - | - | - | Broosa.         |
| 7. "          | - | - | - | Candia.         |
| 8. "          | - | - | - | Adramati.       |
| 9. "          | - | - | - | Mentesche.      |
| 10. "         | - | - | - | Tripoli.        |
| 11. "         | - | - | - | Erzeroum.       |
| 12. Sesamum   | - | - | - | Constantinople. |
| 13. "         | - | - | - | Beyrout.        |
| 14. Sunflower | - | - | - | Moldavia.       |

Among the volatile oils from Turkey, the oil or attar of roses, and the oil of geranium or andropogon used to mix with and adulterate oil of roses, are specially worthy of mention. The oil of orange flowers is also deserving of notice. The series of Turkish oils shown, includes the following:—

|                    |   |                 |
|--------------------|---|-----------------|
| 1. Almonds, bitter | — | Sava.           |
| 2. Fennel          | — | Broosa.         |
| 3. Geranium        | — | Mecca.          |
| 4. Laurel          | — | Salonica.       |
| 5. Lavender        | — | Broosa.         |
| 6. Lemon           | — | Salonica.       |
| 7. "               | — | Scio.           |
| 8. Orange flowers  | — | Constantinople. |
| 9. Geranium        | — | Salonica.       |
| 10. "              | — | Carlova.        |
| 11. "              | — | Kezar.          |
| 12. Peppermint     | — | Jauina.         |
| 13. "              | — | Kezar.          |
| 14. "              | — | Carlova.        |
| 15. "              | — | Saida.          |
| 16. Rosemary       | — | Myrna.          |
| 17. Rose           | — | Kazemlik.       |
| 18. Sago           | — | Elliferm.       |
| 19. "              | — | Constantinople. |
| 20. Sabine         | — | Broosa.         |
| 21. Spike          | — | —               |
| 22. Turpentine     | — | Constantinople. |
| 23. "              | — | Broosa.         |
| 24. "              | — | Nicomedia.      |

Good samples of olive oil are exhibited in the Tuscan collection, by C. T. ORSETTI, of Lucca, from the hilly districts near that place (31, p. 1293); by RUSCHI BROTHERS, from Calci, near Pisa (32, p. 1293); by D. PACINI, from Buti, near Pisa (33, p. 1294); and by the CHEVALIER C. A. SARACINI, of Sienna, from Castel-nuovo, Berardenga, near Sienna (34, p. 1294). These, also, were severally deemed worthy of Honourable Mention.

#### SECTION II.—DYES AND COLOURS.

The arts of dyeing and printing in colours have undergone very considerable modifications during the last half-century, and perhaps no manufacturing processes have received more important assistance from the labours of chemists. Dyeing is purely a chemical operation; and consequently it has improved in exact proportion to the

advance made in the investigation of those chemical laws which regulate the formation of colour, and the union of colouring matter with the various vegetable and animal substances which come under the operation of the dyer. A vast number of new colouring materials have been discovered or made available, and improved modes have been devised of economically applying those already in use; so that the dyer of the present time employs many substances of the very existence of which his practical predecessors were wholly ignorant. From the increased use of many of the vegetable colours, and from the improved modes of applying the colouring matters, a demand has naturally sprung up for various dye-stuffs; and at the present time, many of the dyeing materials of distant countries are beginning to excite the attention of practical men; for though they have long been acquainted with many of these substances, it is only recently that the progress of the art has rendered their use desirable, or even practicable.

At the present time, by far the greater number of the vegetable dye-stuffs used in Great Britain are derived from foreign countries. The following Table shows the quantity of some of the chief of those substances imported in the years 1848, 1849, and 1850; but it must be remarked, that it includes the quantities imported for re-exportation, as well as those retained for home consumption by our manufacturers:—

|                | 1848    | 1849    | 1850    |
|----------------|---------|---------|---------|
|                | Cwts.   | Cwts.   | Cwts.   |
| Cochineal      | 18,380  | 18,254  | 22,451  |
| Fustic         | 154,820 | 175,840 | —       |
| Indigo         | 59,127  | 81,332  | 70,482  |
| Lac dye        | 8,449   | 13,585  | 18,124  |
| Logwood        | 463,840 | 479,840 | 693,800 |
| Madder         | 220,724 | 254,722 | 261,861 |
| Nicaragua wood | 47,220  | 54,020  | —       |
| Safflower      | 8,144   | 10,452  | —       |
| Yellow-berries | 5,421   | 7,761   | —       |

The proportion in which some of the principal dye-stuffs are supplied by different countries is shown in the following table, which represents the imports for 1849:—

|                                | Logwood. | Madder. | Fustic. | Indigo. | Lac Dye. | Safflower. |
|--------------------------------|----------|---------|---------|---------|----------|------------|
|                                | Cwts.    | Cwts.   | Cwts.   | Cwts.   | Cwts.    | Cwts.      |
| East Indian Empire             | —        | 424     | —       | 77,793  | 13,546   | 10,308     |
| British Guiana and West Indies | 84,120   | —       | 25,140  | 73      | —        | —          |
| British North America          | 4,460    | —       | 420     | —       | —        | —          |
| Malta                          | —        | 2,246   | —       | —       | —        | —          |
| France                         | —        | 80,568  | —       | —       | —        | 53         |
| Holland                        | —        | 31,570  | —       | —       | —        | —          |
| Spain                          | —        | 4,091   | —       | —       | —        | —          |
| Naples                         | —        | 34,632  | —       | —       | —        | —          |

The series of HULL IMPORTS includes samples of alkanet root and madder; the yearly average imports being about 60 cwt. of the former, and 18,500 cwt. of the latter.

A numerous and highly-instructive collection of dye-stuffs is exhibited by Mr. W. BURN, of Sewarstone (77, pp. 300-301\*), consisting of the different substances employed as dyes, mordants, &c., in dyeing; forming altogether a complete illustration of the operations of the dyer and calico-printer, and accompanied by specimens exhibiting the various stages through which silk, wool, and cotton fabrics have to pass in the processes of the dyer.

The arts of dyeing and printing, although involving very different processes of manipulation, are, as regards the chemical basis of their operations, essentially the same. Dyeing consists in staining the whole surface of a fabric with the same colour, which is effected, generally, by immersing it in a bath, or a series of baths, more or less heated, by which means the fibre becomes penetrated with the colouring matter thus brought in contact with it.

Printing, on the other hand, consists in staining the surface of a piece of cloth in parts, with one or more colours, or, if entirely covered, in staining it with a variety of colours arranged in pattern. In order to effect this partial staining, and to obtain due clearness of outline in the figure, a decoction or solution of the colouring matter,—or of a proper metallic solution or mordant, by means of which the colouring matter is to be subsequently fixed,—is thickened by mucilage of some kind, usually either gum or starch, in order to prevent its running or spreading beyond the parts intended to be dyed. This mucilage is taken on the surface of the printing blocks, and impressed in proper order on the cloth. It is then allowed to dry, and is afterwards, according to the nature of the colour, either subjected to the action of steam (which merely softens the mucilage and fixes the colouring matter in the cloth without wetting it), or, if a mordant, it is placed in a warm bath with colouring

matter that becomes fixed only on those parts on which the mordant has been printed, and after this the mucilage is readily washed away.

But although the operations of dyeing and printing are thus, to some extent, different, yet the dye-stuffs or colouring matters used are entirely the same, and are applied to produce the same results; so that, in fact, the art of colour-printing, setting apart pattern designing, may be regarded as a mere modification of the art of dyeing.

In the processes of fixing colouring matters, it is found that there are many substances capable of affording very beautiful, useful, and lasting colours, which have not, of themselves alone, a sufficient affinity for the fibre; but which, nevertheless, may be easily combined with it through the agency of certain other substances not in themselves colouring matters, but having an affinity both for the substance of the fabric and also for the colouring matters, by which means the colouring matters are effectually united with the fibre. These substances (the most part metallic solutions), are termed "mordants," and besides their peculiar action in changing the hues of the colouring matters are the means by which some of the most lasting, and therefore most useful, dyes are attained. The bases of the mordants chiefly used are the oxides of iron, tin, copper, and alumina, in combination with sulphuric, muriatic, nitric, acetic, and other acids. From the great diversity of substances used in the art of dyeing, including metals and metallic compounds, woods, flowers, roots, barks, leaves, fruits, insects, &c., all of which respectively require essentially different treatment, there is necessarily considerable variety in the methods and processes employed; and this variety is still further increased by the different nature of the substances dyed—such as wool, silk, leather, cotton, flax, and wood.

In the substances of the greatest importance—wool, silk, and cotton—experience shows that the colouring matter which suits the nature of one does not, necessarily, suit that of another; and indeed, for the most part, the process of dyeing those three substances is so distinct as

to have caused the dyes to be generally divided into woollen, silk, and cotton dyes. It is found that, as regards the use of the strong mineral acids, which are employed both to brighten and—assisted by heat—to fix some colouring matters, an important difference exists between wool, or silk, and cotton. Animal substances will bear, uninjured, a much greater proportion of acid, and of the two, wool being the coarser fibre, is less easily injured than silk; but both will bear, with advantage, a proportion of acid which would corrode and destroy the fibre of cotton. It is necessary, therefore, to be very cautious in the use of acids on cotton goods; and the dyeing of a mixed fabric constitutes one of the nicest parts of the art, where a mixture of animal and vegetable fibres has to be printed with perhaps six or eight brilliant colours at the same time.

In illustration of these processes, Mr. Burch shows a complete collection, *ut supra*, of the various chemical agents employed by the dyer, including acids, alkaline, and alkaline salts; metallic salts, used both as mordants and in the formation of metallic colours, and a very numerous series of vegetable and animal dye-stuffs. The mode of block-printing, and the manner in which several colours are successfully applied, are also well illustrated. The more important of these substances may be briefly stated as follows:—

1. Sulphuric acid, or oil of vitriol.
2. Muriatic or hydrochloric acid.
3. Nitric acid, or aquafortis.
4. Nitro-muriatic acid.
5. Acetic or pyroligneous acid.
6. Citric acid.
7. Tartaric acid.
8. Oxalic acid.
9. Iron sulphate, or green vitriol.
10. „ acetate, or iron liquor.
11. „ nitrate.
12. „ chloride, or muriatic.
13. Tin chloride, or muriate.
14. „ ferripyrosulphate.
15. Alumina.
16. Alum.
17. Alumina, acetate.
18. Copper sulphate, or blue vitriol.
19. „ chloride, or muriate.
20. „ nitrate.
21. „ acetate.
22. Lead, nitrate.
23. „ acetate, or sugar of lead.
24. Zinc sulphate, or white vitriol.
25. Potassa carbonate, or pearl ash.
26. „ bitartrate, or cream of tartar.
27. Potash binosalate, or salt of sorrel.
28. „ ferropotassiate.
29. „ chromate.
30. „ bichromate.
31. Soda, carbonate.
32. Ammonia muriate, or sal ammoniac.
33. Lime, quick.
34. „ chloride, or bleaching powder.

All these substances are used by the dyer, either in preparing the fibre to receive colouring matter, or as mordants to enable it to combine with the colour, in the direct formation of coloured compounds; to heighten animal or vegetable colours; or as “resists,” or “discharges,” either serving to prevent certain parts of the fabric, to which they have been applied, from receiving any colour in the vat, or to discharge or remove it in places where the whole has been dyed one uniform colour. For this important series a Prize Medal was awarded.

The dye-stuffs exhibited are as follows:—

#### COLORING MATTERS OR DYE-STUFFS.

1. Logwood;—obtained from Campeachy in South America, the wood of the *Hamatostylon campechianum*: it is exhibited, 1st, in the block; 2nd, in the chips as cut up for the dyer's use; 3rd, an aqueous extract of the hematin, or colouring principle; 4th, the extract or hematin in the dry state; 5th, the colouring matter precipitated with iron, with which it forms a black dye; 6th, precipitated with tin, with which it forms a purple dye; 7th, with alum, a purple dye; 8th, with copper, a

brown. Specimens are shown of these various colours dyed on cotton, silk, and wool.

2. Peachwood, or Nicaragua wood;—from Lima, South America; the wood of a *Casahuate*, exhibited in the block, chips, aqueous extract, and the colouring matter precipitated black with iron, red with tin, red with alum, and brown with copper. Specimens of dyeing on silk, wool, and cotton.

3. Sappanwood, from Siam;—the wood of the *Casahuate*, exhibited in the block, chips, aqueous extract, and precipitated dark brown with iron, red with tin and with alum, brown with copper; with dyed samples.

4. Fustic, from Cuba;—the wood of the *Rhus cotinus*, exhibited in the block, chips, aqueous extract, and the colouring matter precipitated olive-brown with iron, yellow with tin, and yellow with alum; with dyed samples.

5. Ebony, the wood of the *Diaplycos ebenum*;—exhibited in the block, chips, aqueous extract, and the colouring matter precipitated—olive-brown with iron, yellow with tin and with alum;—with dyed samples.

6. Barwood, from the west coast of Africa;—the wood of the *Baphia nitida* (?); exhibited in the block, chips, aqueous extract, and the colouring matter precipitated,—dark brown with iron, red with zinc; red with alum; brown with copper;—with dyed samples.

7. Camwood, from Sierra Leone;—the wood of the *Baphia nitida*, shown in the block, chips, aqueous extract, and the colouring matter precipitated,—black with iron, red with tin, red with alum;—with dyed samples.

8. Indigo, from the East Indies;—a well-known blue colouring matter obtained from the leaves of the *Indigofera tinctoria*. The process of dyeing with indigo consists in deoxidizing, or depriving it of a portion of its oxygen, when it assumes a green hue, becomes soluble in water, and then readily enters the pores of the cloth immersed in the indigo vat. When the cloth is properly saturated, it is exposed to the action of the air, and the indigo speedily reabsorbs oxygen, and again assumes its original colour and its stability; or, if united with a yellow colouring matter, the result is—a green. It is exhibited in the lump, in powder, in its green deoxidized state dissolved in water; and also in a state of pulp, or minute subdivision, effected by treating it with strong sulphuric acid. In the last case it is not a “fast” dye, but by the first mode of treatment, it is one of the most permanent colours. Samples of indigo dyes are shown.

9. Woad;—from France and the north of Europe, a colouring matter analogous to indigo, but of a duller hue, obtained from the leaves of the *Isatis tinctoria*; it is now but little used. Exhibited in the lump.

10. Quercitron Bark, from South America;—the bark of the *Quercus tinctoria*; it is exhibited in the crushed or ground state, in the aqueous extract, and the colouring matter precipitated—olive-brown with iron, and yellow with alum;—dyed samples are shown.

11. Alder bark;—the bark of the common alder of Great Britain. *Alnus glutinosa*, shown as chips, as aqueous extract, and the colouring matter precipitated,—grey with iron, and pale amber with alum.

12. Catechu, from the East Indies;—an extract of the wood of the *Acacia catechu*, containing much tannin; it is shown in lump, and its colouring or tannin matter precipitated,—black with iron, brown with copper.

13. Valonia, from Turkey and Asia Minor;—the cup or shell of the acorn of the *Quercus agilope*; it is exhibited as gathered. Also the aqueous extract, and the colouring matter as precipitated,—black with iron.

14. Nutgalls, from Turkey;—an excrescence growing on the *Quercus infectoria*, which contains a very large quantity of tannin. It is exhibited as gathered. Also the colouring matter precipitated,—black with iron.

15. Madder;—from France and the north of Europe, the root of the *Rubia tinctoria*. This substance is of great importance in the art of dyeing, furnishing some of the most permanent dyes. It is shown in the root, and ground. Also “garancine,” or the colouring principle, separated by the action of strong sulphuric acid; the black precipitate formed with iron, and the red precipitate

obtained with alga. Madder is the colouring matter used in the Turkey red dye, so celebrated for brilliancy and permanency.

16. Sumach, from Sicily;—is a small plant, the *Rhus coriaria*. The sumach is exhibited as ground for the dyer's use; also its black precipitate with iron,—yellow with tin,—yellow with alum.

17. Weld;—grown in Great Britain and the north of Europe; is a small plant, the *Reseda luteola*, a specimen of which is exhibited. It is used as a yellow dye, or as a component of green. Its aqueous extract and yellow precipitate with alum are shown.

18. Persian berries, from the Levant;—the berries of the *Rhamnus infectoria*, which afford a yellow dye. They are exhibited as gathered. Also the aqueous extract and the colouring matter precipitated,—yellow with alum and with tin.

19. Turmeric, from the East Indies;—the root of the *Curcuma longa*. It is exhibited as a root, and in the ground state as used by dyers. It affords of itself, without a mordant, a yellow dye, which is brilliant, but unfortunately not very permanent, samples of which are shown.

21. Orchil;—(*Rocella tinctoria*), from the Canary Islands, is a lichen, which grows on the rocks by the sea-shore. The plant is of a pale-stone colour, but yields a magnificent purple matter, which fixes in wool and silk without a mordant. It is reddened by acids, and rendered blue by alkalis, thus affording a great variety of tints. Its aqueous purple solution is shown, with samples of dye on silks and wool.

22. Annatto, from South America;—an orange colouring matter obtained from the seed of the *Bixa orellana*. The colouring matter is brought to this country in masses enveloped in rushes. It is soluble in alkalis, by which means it is fixed in the cloth. The annatto is exhibited as a mass, with samples of its dyes.

23. Safflower;—from Egypt, the Levant, Southern Asia, &c.; the dried petals of the *Carthamus tinctoria*, from which is obtained a very beautiful colouring matter, that attaches itself without a mordant, and is extensively used in silk and cotton for a variety of shades of pink, rose, crimson, scarlet, &c., but which, unfortunately, does not possess the power of resisting the action of soap. The safflower as imported is exhibited; also the alkaline extract precipitated a fine rose-colour by an acid, with dyed samples on cotton and silk. This colouring matter is not suitable for wool.

24. Cochineal, from Mexico;—is a small insect, a variety of *Coccus*, which lives upon different species of the *Cactus opuntia* or nopal. It affords a fine red colouring matter, which is extensively used on silk and wool, particularly the latter, the whole range of the best red dyes on wool being due to the colouring matter of this insect. The two varieties exhibited are known in commerce as the "black grain" and "silver grain," terms which arose from the fact that, when first imported, this insect was considered to be a seed or grain, and its dyes were spoken of as "grain" colours. The aqueous and ammoniacal extracts of the colouring matter are shown, also the colouring matter precipitated with tin and with alum. It forms very fine and permanent dyes in reds, crimsons, scarlets, &c., samples of which are shown on wool and silk. It is not applicable as a dye for cotton.

25. Lac-dye, from India;—the colouring matter of "lac," a substance formed on the branches of various trees by the puncture of a small insect, similar to cochineal, the *Coccus lacca*. The resinous matter, being separated, forms the "shellac" of commerce, and the colouring matter, the lac dye, is thus obtained. It is used as a red dye on wool, but its colour is inferior to that from cochineal. The dye is exhibited, with dyed samples.

Having thus briefly enumerated the substances exhibited, it may be observed that the dye samples show merely those colours which result, entirely and directly, from the substances in connexion with which they are placed; and so not, in fact, truly represent the art of dyeing, which frequently depends on a nice mixing of tints, and is effected by the combination of several,—perhaps many,—substances, in order to the attainment of

artistic excellence. But in combination with these dyeing materials, and illustrating the subject as a whole, are exhibited samples of skein-dyeing by three London dyers—by Mr. CHAMBER on wool, by Mr. RAYFOLDS on silk; and Mr. RUMBY on cotton: these may be taken as a fair sample of the uses to which the dyes of London put the variety of drugs and substances we have enumerated. In dyeing the skein previously to the threads being woven, Mr. Burch, who shows all his productions in this combination, exhibits also a series of dyes in "fast colours" on Lisle thread, which are used for the cotton glove manufacture, in which the ordinary dyes are sadly too fugitive; also a series of dyed lace cotton, dressed by a peculiar process to resemble the hard-thrown marabout silk, which is extensively used in the manufacture of velvet, gauze ribbons, and other fabrics in which a firmness of texture is desirable.

Some excellent illustrations of the native vegetable dyes of Scotland are shown in Messrs. LAWSON'S valuable collection (Class III., 105, p. 206). These are now nearly all superseded by cheaper and more brilliant dyes of tropical countries.

A very good series of samples of superior orchil, cudbear, and other preparations of lichens, is exhibited by Messrs. SMITH & SON (68, p. 200\*), accompanied by specimens showing the colours dyed with them. The Jury deemed these dyes of superior excellence, and accordingly awarded a Prize Medal for them.

A highly-complete and instructive series of lichen preparations is exhibited by WOOD & BEDFORD (Class II., 47, p. 192), including the chief varieties of lichens known in commerce, the colouring matters prepared from them, the different peculiar colouring and other principles contained in them, on-obtained from them by chemical processes, and illustrations of the practical uses of lichen dyes to silk, feathers, wool, leather, marble, wood, &c. The chief lichens employed in the manufacture of orchil and cudbear are the following:—

| Commercial Name.  | Plant.                         | Whence Imported.          |
|-------------------|--------------------------------|---------------------------|
| Angola weed -     | <i>Ramalina furfuracea</i> -   | Angola.                   |
| Mauritius weed -  | <i>Rocella fuciformis</i> -    | Mauritius and Madagascar. |
| Lima weed -       | " "                            | Lima.                     |
| Valparaiso weed - | " "                            | Valparaiso.               |
| Cape weed -       | <i>Rocella tinctoria</i> -     | Cape de Verde Islands.    |
| Canary moss -     | <i>Parmelia perlata</i> -      | Canary Islands.           |
| Tartarus moss -   | <i>Parmelia tartarea</i> -     | Sweden.                   |
| Pustulatus moss - | <i>Umbilicaria pustulata</i> - | "                         |
| Velvet moss -     | <i>Gyrophora murina</i> -      | "                         |

Of these nine lichens, the first grows as a parasite upon trees; all the remainder upon rocks: the first is the richest in colouring matter. The samples of cudbear and orchil shown are numerous, and well illustrate the gradual development of the colour: the whole collection is highly creditable, and the Jury, therefore, awarded a Prize Medal for it.

Specimens of safflower, and good illustrations of its use in dyeing silk, are shown by LONG & REYNOLDS (75, p. 205\*): these were deemed deserving of Honourable Mention.

Good specimens of several dye-stuffs are exhibited by J. MARSHALL, of Leeds (Class II., 68, pp. 184-195), including cudbear and orchil, turmeric, and an interesting series of lac-dye: these also were deemed worthy of Honourable Mention.

A sample of chicory wood is exhibited by SATCHEL and GATCHELL, of Dublin (71, p. 200\*). It is stated that this substance, which can be used as a blue dye in the place of real wood, may be profitably grown and sold at about 8l. per ton, the price of real wood varying from 30l. to 30l. per ton.

A large and highly-valuable collection of dye-stuffs is exhibited by the Hon. EAST-INDIA COMPANY, including specimens of the well-known dyes of India, and also of a large number of new and little-known substances em-

played by the natives in different parts of the East Indies (p. 880). This important series forms part of the collection of raw produce for which the Jury recommended the award of a Council Medal. In addition, they awarded a Prize Medal to their Highnesses the RAJAS of KOTAH and of Cutch (p. 880), for the various specimens of dye-stuffs which they have contributed to the East Indian collection.

1. Amongst the more important of the well-known Indian dyes, one of the principal is, of course, indigo, and of this a number of excellent specimens are contributed. The best are those shown by Messrs. MACNATE, of Babcockally; Messrs. ARBUTHNOT, of Cuddapah, and the proprietors of the JORDAH FACTORY (p. 880): for each of these the Jury awarded a Prize Medal. Very good samples of indigo are also contributed by the RAJAS of KOTAH and Cutch, from Kotah and Broach; and also from Sindh and Madras (p. 880). A complete and highly-interesting model of an indigo factory, showing all the different processes through which the dye passes in the process of manufacture, is likewise exhibited.

2. Specimens of the Pala or Palar indigo, prepared in some parts of India from the *Wrightia (Nerium) tinctoria*, a plant which flourishes in dry and barren lands, are contributed by Mr. G. T. FISCHER, of Salem (p. 880). It is said that this indigo is occasionally mixed with the ordinary indigo of commerce. The Jury awarded a Prize Medal for these specimens.

3. Fair samples of safflower or Kussoumba, *Carthamus tinctorius* (p. 880), are contributed by the RAJAH of KOTAH, from Kotah; by W. S. HUDSON, from Assam; from Deca; from Rohilkund; from the Celebes; and from the neighbourhood of Calcutta. There is probably no dye more easily injured by careless collection than safflower: the great superiority of the Chinese over the ordinary East Indian safflower is chiefly due to the greater care with which the Chinese collect it.

4. Turmeric, *Curcuma longa* (p. 880), is sent from Nepal by his Highness the MAHARAJAH; from Assam; from the Rajpootana states; from Rohilkund; from Calcutta; from Beerbhoom; from Cuddapah; from Bombay; from Madras; and from Java.

5. Sappan-wood, *Casualpia sappan* (p. 880), contributed from Bengal; from the Tenasserim provinces; and by TAN KIM SENG from Siam, and from the Philippine Islands.

6. Munjeet, Munjuth, or Indian madder, *Rubia munjistha* (p. 880). This is a valuable dye-stuff, and hitherto not so well appreciated as it deserves, for some of the colours dyed with it are quite as permanent as those dyed with madder, and even more brilliant; its use is, however, gradually increasing, and it is unquestionably well worthy the attention of dyers. Good samples are exhibited by Captain SMITH, from Assam (p. 880). For these the Jury awarded a Prize Medal.

Specimens of Munjeet are also contributed from Nepal by his Highness the MAHARAJAH; from Aßen; and from Calcutta.

7. Chay-root, *Oldenlandia umbellata*, a red dye similar to Munjeet, and used to a great extent in the southern parts of Hindostan by the native dyers. This dye is not held in very good estimation in Europe; it seems, however, to deserve a better reputation than it at present possesses. Attention to this dye-stuff was drawn in 1798 by a special minute of the Board of Trade, recommending its importation; but Dr. Bancroft, who made some experiments with a sample of damaged chay-root, considered it inferior to madder, and hence discouraged its further importation. Specimens are contributed by Captain OULVIA, from Masulipatam and from Palamcottah (p. 880). Samples of the Bulu or Mangkudn wood, and root, much used throughout the Indian Archipelago, are shown from Malacca, Java, and the Celebes.

8. Annotto. The seeds of the *Bixa orellana*, from which this colouring matter is prepared, are contributed from Assam, and from the vicinity of Calcutta.

9. Morinda bark. The bark and root of various species of Morinda are used in different parts of the East Indies, and are considered as a very valuable red dye. Specimens

of the Muddi or Al, *Morinda citrifolia*, are exhibited by the RAJAH of KOTAH from the Rajpootana states; and Ach, or *Morinda tinctoria*, are contributed from Patna. The colours dyed with the Morinda are, for the most part, not brilliant; but the colouring matter is far more permanent than many other red colours are, and with improved management would probably rival that of madder; it would, therefore, perhaps, be a useful dye-stuff; it appears well worthy the attention of dyers.

10. Lichens. A considerable number of different lichens are shown from various localities; some of these contain a good deal of colouring matter, and might, therefore, be advantageously employed in the manufacture of orchil, cudbear, and other preparations used by dyers. Among the specimens exhibited may be mentioned those from Rohilkund; from Moorsheadabad; from Darjeeling; and other parts of the Himalayas; from the Tenasserim provinces; and from Sindh.

11. Mangrove bark. *Rhizophora mangle*;—used to dye a chocolate colour, from Arrakan. This was one of the colours introduced by Dr. Bancroft, and for the exclusive use of which he obtained an Act of Parliament.

12. Pulas, Tisso, or Madooga flowers;—*Butea frondosa*, used for dyeing red, from Tanna, from the district of Beerbhoom; from Cuttack; and by Captain OULVIA, from the Nizam's country (p. 881).

13. Harsinghar flowers;—*Nyctanthes arbor-tristis*, used as a yellow dye, from the RAJAH of KOTAH, in the states of Rajpootana; and from Cuttack (p. 879).

14. Ukulhere or usburgh;—*Datisca cannabina*, a bark used for dyeing yellow; it contains a bitter principle resembling that of quassia, from Lahore.

15. Marking nut;—*Semecarpus anacardium*, from Assam, from Calcutta, and from Rohilkund.

16. Capilla Ringhill, Rerso, Patany;—prepared from the dried fruit of the *Rottlera tinctoria*, and used by the natives to dye orange: the colouring matter is apparently of a resinous nature, or at least is accompanied by a large quantity of resin; it is a brilliant and tolerably permanent dye; contributed from Assam and from Cuttack.

17. Gajn gum;—used as a yellow dye, from the Celebes.

18. Gamboge, (*Hebradendron gambogoides*). Several excellent specimens are contributed from different localities. A good sample from Siam is exhibited by G. G. NICOL; and another is shown by Messrs. HAMMOND, in their collection of Archipelago produce (2, p. 998). Other specimens of gamboge (*Garcinia tinctoria*) are contributed from the peninsula of India, by several exhibitors, especially by Dr. CLEGHORN from the forests of Mysore; for this the Jury awarded a Prize Medal to him.

19. Myrobolans;—the fruit of various species of *Terminalia*, containing a considerable quantity of astringent matter, and therefore used in tanning as well as in dyeing; from Moorsheadabad, Calcutta, Rohilkund, Cuttack, Mirzapore, Assam, and the Rajpootana states.

20. *Quercus infectoria*, galls, from Calcutta and Chota Nagpore.

21. *Abutilon striatum*, from Calcutta and from Assam.

22. *Myrica sapida*, bark, from Rohilkund.

23. *Wrightia antidysenterica*? from Patna.

24. Haradah berries (*Terminalia sp.*?), from the hill tracts of Orissa.

25. Rerro, a purple dye, from Arrakan.

26. Thi-nan-weng, a chocolate dye, from Arrakan.

27. Sagah bark, from Singapore.

28. Ting-njet, bark and wood, used as a dark purple dye, from Arrakan.

29. Thi-tet, wood and bark used to dye red, from Arrakan.

30. Mooshe, from the Rajpootana states.

31. Mucha, from the Rajpootana states.

32. Kayea Kudrang, a yellow dye sent by SEYD QANAR from Malacca.

33. The-dan, a red dye, from Arrakan.

34. Bordi, from the Rajpootana states.

35. Bunchong Balu wood, from the Celebes.

36. Muethkee, from the Rajpootana states.

37. Samak bark, from Singapore.
38. Lopisap bark, from the Celebes.
39. Benkita-barrang, produces a dark purple dye, from Borneo.
40. Kayu Jobah, a red dye, from Labuan.
41. Kayu Samak, from Labuan.
42. Saracendraputtah (*Cassia fistula*), from Palamcottah.
43. Puttanguh bark, sent from the Nizam's country by Capt. OGILVIE.
44. Cherenjee bark, from the Nizam's country, sent by Capt. OGILVIE.
45. Avaraputtai\* (*Cassia auriculata*), from Palamcottah.

Of many of these dyes, little or nothing more than the name is known, and the Jury, having no evidence as to their use, are, therefore, wholly unable to express any opinion as to their probable utility in this country. They consider the series, however, as highly valuable and important. Several of the dye-stuffs are evidently rich in colour; most of them may be easily had in large quantities, and at comparatively low prices; they are, consequently, well worthy of the attention of practical dyers. Specimens of gamboge, turmeric, myrobolans, and a yellow resinous substance resembling gamboge, called Jaju gun, are contributed from Ceylon.

A sample of lichen, or orchilla weed, from the Cape of Good Hope is exhibited by C. WATKINSEY (51, p. 952).

A specimen of cam wood, from the confluence of the rivers Niger and Tchadda, is shown by Dr. Mc WILLIAM (5A, pp. 953, 954), and some crude indigo from Abbrakint, is contributed by Dr. BIRCHAM (12, p. 954).

In the collection from British Guiana, there is but one dye or colouring material, namely, the "Lana dye," exhibited by H. A. JOCK (55 B, p. 930). This substance is obtained from the fruit of the Lana tree (*Genipa Americana*, Lamour.), a tree very abundant throughout the colony, particularly on the banks of the river Berbice; the colour dyed with it is a good bluish black. The colours dyed with the fruit of this tree are remarkably permanent, a fact which has very long been known, though hardly any attempt appears to have been made to introduce it to the notice of European dyers. The Jury deemed this specimen worthy of Honourable Mention.

Samples of fustic (*Rhus cotinus*); logwood (*Hematoxylon campechianum*); and turmeric, are included in the Trinidad collection of raw produce.

A promising specimen of lichen, or orchilla weed from the Falkland Islands (*Rocella fuciformis*), is exhibited by G. T. WHITTINGTON (p. 987).

The various dark-coloured resins of Australia have already been alluded to; the colouring matters of the different species of *Xanthorrhoea*, though not remarkably brilliant, are well worthy of notice. Very fine specimens of some of these resins are exhibited by the COLONIZATION ASSURANCE CORPORATION. (See page 76).

Good samples of the *Xanthorrhoea* resins are shown from Flinders' Island, by J. MILLIGAN (51, p. 994).

A remarkable colouring material, called blood juice, the produce of a Norfolk Island tree, and said to be used for dyeing calico, and as an indelible marking ink, is contributed by Sir W. DUNSTON (290, p. 907). The Jury deemed this substance worthy of Honourable Mention.

Specimens of Hinan (*Elaeagnus himan*), a bark used in New Zealand for dyeing black (5, p. 1001), are exhibited by McVAY; these will be easily referred to as a tanning material. The flax and oil or substances shown in illustration of the use of this bark by the natives, in dyeing black, are remarkable for the depth and brilliancy of the dye.

Lichen, or orchilla weeds from New Zealand, is contributed by J. A. SMITH (14, p. 1001); this sample appears to contain a good deal of colouring matter, and was, therefore, deemed worthy of Honourable Mention.

A very fine sample of Alkanet root (*Anchusa tinctoria*) is shown in the Algerian collection.

Specimens of lacquer, or saffron; turmeric; and a red colour from China, are exhibited by HER MAJESTY'S CONSUL at Shanghai (p. 1418); samples of whi-mei, a

green dye; and of the fruits of the *Gardenia radicans*, used to dye yellow, are also shown.

In the Egyptian collection are specimens of indigo, saffron, and sumach.

The specimens of French madder, though not numerous, are of considerable interest and importance. A small series of samples of madder, and of garancine, as obtained from madder for the use of the dyer, are exhibited by the CHAMBER OF COMMERCE at Avignon\* (1049, p. 1229). The Jury awarded a Prize Medal for these specimens.

A good specimen of garancine is also shown by LAZARE and LACROIX, of Avignon (905, p. 1223). This affords a highly-interesting example of the practical application of science to the improvement of a natural product. The exhibitors, finding their madder inferior to that grown in other localities, were led to institute a chemical examination of the soil; it was found to be deficient in lime, an element of all those soils in which the best madder is grown; the land was accordingly well manured with lime, and the result was a marked improvement in the quality of the madder. The Jury awarded a Prize Medal for this specimen.

Some excellent samples of orchil are exhibited by C. MORTIER (932, p. 1224). For these, also, the Jury awarded a Prize Medal.

Madder, of very superior quality, is likewise shown in the Algerian Department of the French collection; in particular, the specimens of G. DE MONTIGNY, of St. Joseph, Oran (38, p. 1261), who also shows a fair sample of saffron, were deemed worthy of commendation, and the Jury accordingly awarded a Prize Medal for them.

The samples of madder, exhibited by J. PROLLA, of Constantine (43, p. 1261), and of DUPRE DE ST. MAUR, of Oran (22, p. 1261), were likewise considered very good, and each worthy of Honourable Mention.

A fine specimen of saffron, contributed by DE LUTZOW (34, p. 1261), of Bonn, Constantine, was deemed worthy of Honourable Mention.

A good sample of "wood," the blue colouring matter prepared from the *Isatis tinctoria*, and which is probably identical in nature with indigo, is shown by GIMMELER, of Tüchtelborn, near Erfurt (Zollv. 4698, p. 1089). This was deemed worthy of Honourable Mention.

Madder root, from Athens, is contributed by A. MALANDRINUS (3, p. 1400), and from Euboea, by G. PHILLIPPOU (4, p. 1401).

The colouring matter of safflower, prepared in a concentrated form for the use of dyers, is exhibited by C. JAHNER (Prussia 469, p. 1078).

Extract of madder, said to be prepared by a new and cheap process, is shown by A. SCHARENBERG, of Neustadt (3, p. 1134).

A remarkable yellow resinous substance, somewhat resembling gamboge, and called pipitzahuac, but of which no description is given, is contributed from Mexico.

In the Portuguese collection, several specimens of dyeing materials are shown. The most important are a set of lichens, or orchilla weeds, namely, wood orchilla, from Angola, St. Thomas, and Mozambique; and rock orchilla from Angola, Vinha do Minho, Cape Verde Islands, and from Madeira (505 to 508 n). These were deemed worthy of favourable notice.

Wood orchilla from the Cape rock, and rock orchilla from the Beilungues Islands, of good quality, are shown by F. R. BATALHA (509 and 509A). Some good samples of sumach are exhibited by M. B. FERREIRA, junior (510, p. 1313). These were deemed severally worthy of Honourable Mention.

Two good samples of Russian madder are shown from the GOVERNMENT OF DERBENT. This important root is already cultivated to a considerable extent in Russia, but not nearly in sufficient quantity to meet the demand; so that large quantities are imported from Holland, and elsewhere, every year. The specimens shown, which are of good quality, are exhibited by KENNETH RAGHIM OGIL, of Cubi (87, p. 1369), and by BARATEFF AKAKEL (86, p. 1369). These were each deemed worthy of Honourable Mention.

Besides these, the Russian collection includes safflower, from Tefaff, in Tiflis, exhibited by POPUS KVAVILOFF (90, p. 1389); saffron, from Beki, in Shemakha, exhibited by SERGIUS AYVARSOF (91); yellow berries (*Rhamnus tinctoria*), from Cubi, in Derbent (92); sumach, from Nooklia, in Shemakha (93); and the wood of the *Statice ciliaris*, from the GOVERNMENT OF STAVROPOL (94).

A considerable number of specimens of dyeing materials from Spain are exhibited; the best are, the madder; wood or pastel blue (*Isatis tinctoria*); safflower or alizar (*Carthamus tinctorius*); wild sumach; and weld or "gualda" (*Reseda luteola*); shown by the AGRICULTURAL BOARD of SARAGOSSA (148, p. 1337-38). For these the Jury awarded a Prize Medal. (See page 71).

Superior samples of madder are likewise contributed by the Province of Murcia (86, p. 1334); D. —, of Valladolid (142, p. 1337), and A. MATESANZ, of Segovia (144, p. 1337). These were severally deemed worthy of Honourable Mention.

Other specimens of madder are shown by the Province of Cadix, which exhibits the wild or indigenous madder from San Lucar (138, p. 1337), by D. —, of the Canary Islands (141, p. 139c), by D. —, of Huelva, by D. MATESANZ, of Segovia, from Cuellar (140, p. 139c), by R. SEMOVILLA, of Segovia, from Cuellar (143, p. 139), and by D. —, of Zamora (91, p. 1334). Extract of madder, for dyers, is also contributed by J. MARCOSA, of Valladolid (147, p. 1334).

Samples of gualda or weld (*Reseda luteola*) are exhibited by J. GISMERT, of Alicante (137, p. 1337), by D. —, of the Canary Islands (141, p. 1337), by D. —, of Gerona (79, p. 1333), by D. —, of Murcia (86, p. 1337), by J. MARTINEZ, of Seville (145, p. 1334), and by D. —, of Zamora (91, p. 1334).

Two specimens of saffron are shown, namely, by DONA E. CABELLO, of Ciudad Real (139, p. 1337), and by D. —, of Saragossa (92, p. 1334).

A good sample of Alkanet root (*Anchusa tinctoria*) is contributed by D. —, of Murcia (86, p. 1334), and a fair sample of sumach, from Torrelodon, is shown by D. —, of Valladolid (146, 1337).

Three specimens of dye-woods are shown in the collection of Cuba woods, exhibited by the BOTANIC SOCIETY of MADRID (186), these are—

Brasil wood - *Cesalpinia* sp.  
Copey - - - *Clusia rosea* (Lam.)  
Fustete - - - *Broussonetia tinctoria* (Kunth).

In the collection from Tunis are shown three samples of indigo; one of saffron; dried pomegranates, said to be used for dyeing yellow; and a specimen of a dye-stuff named Gämman.

A very valuable and numerous series of dye-stuffs is exhibited in the Turkish collection, including some of those well known in commerce, and also a few new ones. Samples are shown of—

1. Madder - - - Smyrna.  
2. " - - - Ghiorides  
3. " - - - Amassiah.  
4. " - - - Broosa.  
5. " - - - Monastir.  
6. " - - - Bakir.  
7. " - - - Tripoli.  
8. " - - - Bulak Hissar.  
9. " - - - Koniah.  
10. " - - - Kukagasch.  
11. " - - - Cayadjik.  
12. " - - - Angora.  
13. Yellow berries - - - Angora.  
14. " - - - Siras.  
15. " - - - Janina.  
16. " - - - Tokat.  
17. " - - - Kaisarieh.  
18. " - - - Wallachig.  
19. " - - - Koniah.  
20. " - - - Sila A. Minor.  
21. Safflower - - - Amassiah.  
22. " - - - Sparta.  
23. " - - - Smyrna.  
24. " - - - Constantinople.

25. Safflower - - - Moldavia.  
26. Saffron - - - Philippopol.  
27. " - - - Tripoli.  
28. " - - - Sadranboli.  
29. Tabach - - - Koniah.  
30. Sirpik - - - Nish.  
31. Amteric - - - Tripoli.  
32. Alkanet - - - Bouldour.  
33. " - - - Constantinople.  
34. Kina - - - Mecca.

Besides these, a considerable number of samples of galls, valonia, sumach, and other similar substances, used both in dyeing, and also in tanning, are exhibited. (See page 93.) The substance called Tabach, from Koniah, appears to be the dried petals of a flower; it is a rich violet colour, and merits further examination. Sirpik is said to be used in dyeing yellow.

A good series of samples of madder, both in the form of root, and also reduced to a powder, for the use of dyers, is exhibited by the TECHNOLOGICAL INSTITUTE of TUSCANY (47, p. 1294), and forms part of the collection for which the Jury awarded them a Prize Medal. (See page 71.)

#### SECTION IV.—TANNING MATERIALS.

Notwithstanding the number of different substances which have from time to time been introduced for the use of tanners, it is, nevertheless, pretty generally acknowledged that there is nothing superior, or even equal to, good oak bark, and that all attempts to hurry the process beyond a certain point by the use of concentrated solutions of tan, &c., are for the most part failures, as the manufacture of good leather, to a great extent, depends on the process being conducted in a slow and gradual, but—at the same time—thorough and complete manner. Oak bark is, however, by no means the only astringent bark well suited to the use of the tanner, and in various parts of the world other similar substances are used with very great success. All these tanning materials, though they may not be considered, by the English tanner, as equal to the best oak bark, are nevertheless of value to him, they may be employed in conjunction with oak bark, or even as a substitute in times of scarcity, or when the price of bark is high. In fact, the very existence of such substances tends to keep down and equalize the price of bark, and prevent it from undergoing those great fluctuations in value which would necessarily occur were it the only tanning material available to our manufacture.

The quantity of the chief tanning materials imported in 1849, and the countries from which they were obtained, is shown in the following table.—

|                        | Tanning Bark, &c. | Terra Japonica. | Sumach. | Valonia. |
|------------------------|-------------------|-----------------|---------|----------|
|                        | Cwts.             | Cwts.           | Cwts.   | Cwts.    |
| Belgium                | 141,332           | —               | 140     | —        |
| Holland                | 114,180           | —               | —       | —        |
| East Indian Empire     | —                 | 169,140         | —       | —        |
| Naples and Sicily      | 7,166             | —               | 218,380 | —        |
| Turkey                 | —                 | —               | —       | 236,500  |
| America                | 42,318            | —               | —       | —        |
| Bergan                 | —                 | —               | —       | —        |
| Australian Territories | —                 | —               | 29,840  | 15,820   |
| Morocco                | 27,619            | —               | —       | —        |
| Norway                 | 12,784            | —               | —       | —        |
| Spain                  | 9,594             | —               | 440     | —        |
| Tuscany                | 9,931             | —               | 20      | 4,320    |
| Australia              | 4,563             | —               | —       | —        |
| Syria                  | —                 | —               | —       | 4,260    |
| Greece                 | —                 | —               | —       | 10,480   |
| Miscellaneous          | 3,035             | —               | 2,980   | 2,520    |
| Total                  | 368,582           | 169,140         | 231,800 | 333,420  |

A valuable and instructive series of the various tanning materials, imported into England, or used by tanners, is exhibited by CURTIS BROTHERS and Co. (126, p. 204); the following Table shows the names of these substances:—

|                                    |                            |                  |
|------------------------------------|----------------------------|------------------|
| 1 to 6. Oak bark -                 | <i>Quercus pedunculata</i> | England.         |
| 7 and 8. " -                       | " "                        | Flanders.        |
| 9 and 10. Larch bark               | <i>Pinus larix</i>         | Scotland.        |
| 11. Mimosa bark -                  | <i>Acacia</i> sp.          | New South Wales. |
| 12. Babool bark -                  | <i>Acacia Arabica</i>      | Bengal.          |
| 13. Cork-tree bark                 | <i>Quercus suber</i>       | Laruche.         |
| 14. " "                            | " "                        | Rabat.           |
| 15 and 16. Hemlock }<br>bark - - - | <i>Abies Canadensis</i>    | United States.   |
| 17. Sumach - - -                   | <i>Rhus coriaria</i>       | Sloly.           |
| 18 and 19. Valonia                 | <i>Quercus agrifolia</i>   | Smyrna.          |
| 20. " "                            | " "                        | Trieste.         |
| 21. " "                            | " "                        | Morea.           |
| 22. Divi Divi -                    | <i>Casalpinia coriaria</i> | Maracaibo.       |
| 23. " "                            | " "                        | Rio de la Hache. |
| 24. " "                            | " "                        | Savanilla.       |
| 25. Myrobalans -                   | <i>Terminalia</i> sp.      | Bengal.          |

|                             |                             |            |
|-----------------------------|-----------------------------|------------|
| 26 and 27. Terra Japonica - | <i>Nauclaea Gambier</i>     | Singapore. |
| 28. Cutch - - -             | <i>Acacia catechu</i> , &c. | Pegu.      |
| 29. Cutch, black -          | " "                         | Calcutta.  |

The Jury awarded a Prize Medal for this complete and instructive series.

A considerable number of tanning materials are also shown by Messrs. BEVINGTONS and Sons, as illustrations of the process of tanning generally (Class XVI., p. 518). The specimens exhibited are small, but valuable, as being shown in conjunction with the prepared leather, and therefore as illustrating the practical application of the several substances; the Jury deemed this series worthy of Honourable Mention.

An instructive and highly useful series of these substances are also shown in the collection of LIVERPOOL IMPORTS; these are as follows;—

| Commercial Name. | Plant.                       | Whence Imported.  | 1849      | 1849      |
|------------------|------------------------------|-------------------|-----------|-----------|
| Oak bark -       | <i>Quercus</i> sp. -         | Holland; Belgium  | Tons. 296 | Tons. 514 |
| Cork-tree bark - | <i>Quercus suber</i> -       | Rabat -           | ..        | 160       |
| Divi divi -      | <i>Casalpinia coriaria</i> - | Maracaibo -       | ..        |           |
| " -              | " -                          | Rio de la Hache - | ..        |           |
| " -              | " -                          | Savanilla -       | ..        |           |

| Myrobalans -     | <i>Terminalia chebula</i> -  | East Indies -     | 185       | 851       |
| Terra Japonica - | <i>Acacia catechu</i> -      | East Indies -     | ..        |           |
| Cutch -          | " -                          | Calcutta -        | 903       | 742       |
| " -              | " -                          | Singapore -       | ..        |           |
| Kassur -         | <i>Acacia catechu</i> -      | Ceylon -          | ..        |           |
| Sumach, ground   | <i>Rhus coriaria</i> -       | Trieste -         | ..        |           |
| " -              | " -                          | Palermo -         | 93        | 93        |
| " -              | " -                          | Marseilles -      | ..        |           |
| Sumach, leaves   | " -                          | Trieste -         | ..        |           |

Specimens of oak bark, gambier, myrobalans, sumach, and valonia are included in the collection of HULL IMPORTS; the yearly importation of these substances into the port of Hull is about 2,500 tons.

A fine sample of pure Palermo sumach is exhibited by J. KITCHIN (126A, p. 205\*), as ground for the use of tanners and dyers.

Besides the tanning materials already imported, a considerable number of new or little known astringent substances are shown in the East Indian collection, some of which appear well to merit the attention of practical men. Amongst those exhibited are the following:—

1. Terra japonica, kut or cutch, and catechu, the well-known extracts of the *Acacia catechu*, and certain allied plants, from Ratnagerry, Calicut, Moorsheadabad, Patna, Calcutta, Rohilkund, &c. Gambier, the extract of the *Nauclaea gambier*, from Singapore.

2. Acacia or Babool bark, the bark of *Acacia arabica*, and *A. catechu*, &c., from Madras, Scinde, Shahjehanpore, Rohilkund, and Assam.

3. Mangrove bark, the bark of the *Rhizophora Mangle*, from Arracan, Malabar, and Singapore.

4. Turwar or cassia bark; Avaraputtai, Tangada jigota (*Cassia auriculata*), from Vizagapatam; and Sarcondraputtai, *Cassia fistula*, from Madras and Tinnevely.

5. Seal-tree bark, *Shorea robusta*, from the Saul forests.

6. Pomegranate rind, *Punica granatum*; Darunka puche, Dadims jegota, from Kerman and Vizagapatam; Dalunka khola, from the vicinity of Calcutta.

7. Jamcoo bark, *Eugenia jambolana*, from Cuttack, and the Chota Nagpore division.

8. Samak bark, from Singapore.

9. Peel bark, from Cuttack.

10. Dhak gond, pulp, of butea kino, the red astringent exudation of the *Butea frondosa*, from Rajpootana, Cuttack, Vizagapatam, and Meerut.

11. Yanguy or gudi kino, *Pterocarpus dalbergoides*, from Malabar.

12. Kino, or astringent extract of the *Buchanania latifolia* (?), from the district of Chota Nagpore.

13. Majophul, or gall nuts, *Ficus infestoria*, &c., from Chota Nagpore and Rohilkund divisions.

14. Sumrut ool Uec, or tamarisk gall, *Tamarix indica*, from Bombay and Lahore.

15. Divi divi, *Casalpinia coriaria*, recently introduced from South America, contributed by Dr. FALCONER, from the Botanical Garden at Calcutta.

16. Terec, *Casalpinia* sp., contributed by A. SCONCE, from Chittagong.

17. Myrobalans, the dried fruit of various species of *Terminalia*, extensively used both in dyeing and for tanning; *Terminalia bellerice*, Baheera bhura (or hurrah), from Mirzapore, Rohilkund, and Calcutta; *Terminalia chebula*, from Rohilkund and Patna. *Terminalia citrina*, from Patna, Moorsheadabad, Cuttack, and contributed also from Assam by Captain SMITH (p. 881). *Terminalia elata*, (?) Marada, from Mirzapore. *Terminalia angustifolia*, humtokee, from Calcutta.

18. Emblic myrobalans, aomla berries, *Phyllanthus emblica*, from Rajpootana.

19. Mochrus, *Bombax malabaricum* and *B. heptaphyllum*, from Meerut.

20. Gaub, the fruit of *Diospyros glutinosa*, from Calcutta.

From the Cape of Good Hope M. THALWITZER sends samples of tanning bark (3 and 27, p. 249, 250), apparently the bark of a *Mimosa*. Deserving of Honourable Mention.

Some good samples of hemlock bark, illustrating its use as a tanning material, are exhibited by J. ALLON, of Montreal (100, p. 195). These the Jury deemed interesting, and deserving of Honourable Mention.

Specimens of the bark of the hog-plum tree, *Spondias lutea*, abundant on the banks of the river Berthe, and which is commonly used in British Guiana for tanning, are shown by T. B. DUGGON (56, p. 280). A sample of Courida bark, *Avicennia nitida*, a tree very common on the eastern coast of Demerara, likewise used in tanning, is exhibited by D. SMITH (58, p. 280).

Mimosa bark, bark of the black wattle tree, *Acacia mollissima*, and mimosa extract, the inspissated decoction of the bark, are contributed by T. BUTTON of Launceston (22, 23, p. 993). These also were deemed worthy of Honourable Mention. A specimen of the same bark is likewise exhibited by — REES (314, p. 998), as prepared for the use of tanners, by chopping into small fragments. Kino from the blue-gum, *Eucalyptus globulus*, the stringy bark, and other *Eucalypti* indigenous to Australia, are contributed by J. MILLIGAN and H. HULL (288, p. 997), and by the COLONIZATION ASSURANCE CORPORATION.

Several good specimens of New Zealand tanning barks are exhibited by J. M'VAY (5, p. 1001). They are accompanied by hides tanned with the different barks, which are labelled Towai, Tanekaha, and Hinan, the latter being also used in dyeing black. The Jury considered these samples as deserving Honourable Mention.

Samples of New Zealand tanning barks are also shown by TAO NUI, a New Zealand Chief (Gillman, 44, p. 198<sup>v</sup>). Some good specimens of oak bark from Bruges are exhibited by STRUENSE and BAER of that city (97, p. 154). These the Jury deemed worthy of Honourable Mention.

Specimens of oak bark, in the state used by tanners, are shown by the BOARD of AGRICULTURE of the GRAND DUCHY of HESSE DARMSTADT (13, p. 1126, 1127).

Good samples of Portuguese sumach are exhibited by MANOEL BAPTISTA MONTEIRO, from Beira-guarda, Algarve, &c. (510, 511, 512, 513, p. 1313).

Bark or rind of the wild pomegranate, *Punica granatum*, and of the wood and leaves of the smach tree, are contributed from the GOVERNMENT of KHEMAKHA, districts of Shoosha and Mookha, in the Russian empire (88 and 93, p. 1369).

In the collection of raw produce exhibited by the AGRICULTURAL BOARD of SARAGOSA (148, pp. 1337, 1338) is a good specimen of wild sumach; a good sample of sumach is likewise contributed from Torrelobaton, by D. — of Valladolid (146, p. 1337).

Specimens of tanning materials are exhibited by ERHAGE ALY ELMAJBOOR, in the collection from Tunis (137, p. 1416). These were deemed worthy of Honourable Mention.

Excellent samples of several important tanning materials (p. 1386), well known in commerce, are shown in the Turkish collection; these include—

#### SECTION V.—FIBROUS SUBSTANCES.

This division is, perhaps, one of the most important of the whole series of raw produce, including as it does the materials for several of our most important manufactures

—cotton, flax, hemp, and the numerous vegetable fibres employed in conjunction with, or as substitutes for, those substances. For convenience of arrangement, the subject is divided in the following pages into three distinct heads: the first, including the different varieties of cotton; the second, flax and hemp; and the third, consisting of the various other vegetable fibres.

#### COTTON.

The total quantity of cotton, at present annually imported into Great Britain is very nearly 800,000,000 pounds; the proportion in which it is imported from different countries is shown in the following Table, which represents the imports of 1849:—

|                                | lbs.        | Per cent. |
|--------------------------------|-------------|-----------|
| United States                  | 634,504,050 | 83.9      |
| East Indies                    | 70,838,515  | 9.3       |
| Brazil                         | 30,738,183  | 4.        |
| Egypt                          | 17,035,928  | 2.2       |
| British Guiana and West Indies | 944,307     | 0.1       |
| Cuba                           | 292,578     | —         |
| New Granada                    | 258,650     | —         |
| Hayti                          | 245,032     | —         |
| Austrian Territories           | 199,527     | —         |
| Turkey                         | 115,197     | —         |
| Venezuela                      | 106,135     | —         |
| Peru                           | 82,011      | —         |
| Russia                         | 11,536      | —         |
| South African Colonies         | 7,889       | —         |
| Miscellaneous                  | 89,524      | —         |
| Total lbs.                     | 755,469,012 | 100.      |

A very useful collection of cottons of different countries, arranged so as to show the peculiarities of each fibre, is shown by Dr. ROYLE (107, p. 203<sup>v</sup>). An extensive series of the cottons imported into Liverpool is likewise exhibited in the LIVERPOOL collection of imports (pp. 811, 812); these are accompanied by memoranda of the selling prices of each variety in the Liverpool market in October 1850, which, though very useful and instructive, it must be remembered do not express the true average value of the different cottons at all times, but merely their price at that particular period. It is evident that accidental circumstances may, at any time, cause a rise or depression in value of a particular cotton, as well as give rise to fluctuations in the price of cotton generally.

|                    |                     | Oct. 1850.   |
|--------------------|---------------------|--------------|

| Do.                | Mobile (Mammoth)    | 10d.         |
| Do.                | New Orleans         | 7½d. to 10d. |
| Do.                | Sea Island          | 8d. to 10d.  |
| Do.                | Sea Island (picked) | 2s. 6d.      |

A good deal of uncertainty appears to prevail respecting the botanical distinctions to be noted between the various cotton plants of different countries; some botanists admitting the existence of a large number of distinct species of the genus *Gossypium*, whilst others con-

sider them as chief varieties of a much smaller number of separate species. According to Dr. Royle, who has most recently investigated the subject, the different varieties of cotton may be classed under four distinct species of *Gossypium*, in the following manner:—

1. *Gossypium indicum* (or *herbaceum*); the cotton plant of India, China, Arabia, Persia, Asia Minor, and some parts of Africa.

2. *Gossypium arboreum*; a true cotton, indigenous to India.

3. *Gossypium barbadense*; the Mexican or West Indian cotton, of which the Sea Island, New Orleans, and Upland Georgian cottons are varieties. It was long since introduced into the Island of Bourbon, and thence into India; hence it acquired the name of Bourbon cotton.

4. *Gossypium peruvianum*, or *acuminatum*; which yields the Pernambuco, Peruvian, Marauham, and Brazilian cotton, especially distinguished by its black seeds, which adhere firmly together: this variety, also, has long since been introduced into India.

The important discovery, by MERCER, of the influence of caustic alkali in modifying the fibre of cotton, has been already alluded to. He has shown that, by steeping cotton in a cold solution of caustic soda, the fibre loses its flattened ribbon-like form, and assumes a more or less cylindrical shape. This change gives rise to three remarkable effects: the fibre becomes smaller, it gains in strength, and at the same time it acquires an increased affinity for colouring matter. After a minute and careful examination of these effects, the Jury, being convinced of the high practical value of the process, determined to recommend the award of the Council Medal to Mr. MERCER (38, pp. 555, 556, see p. 69).

The collection of raw cotton exhibited by the Hon. EAST INDIA COMPANY (pp. 882, 883), is, as might be expected, large and highly interesting. It consists of a series of samples of the indigenous cottons of various parts of the Indian empire, and samples of the cottons raised in the various Government experimental farms during the last thirty years, illustrating the effects produced, and the improvements effected, by the numerous attempts which have been made during that period to improve the cotton cultivation of India.

In considering the native cultivation of cotton in India, it must be remembered that, besides the exports to Europe, very large quantities have every year been raised for home consumption by the native manufacturers, and for exportation to other eastern countries,—especially China;—the latter alone having, till within the last few years, generally exceeded the entire annual quantity exported to Europe. Thus, during the ten years preceding 1833 the quantity of raw cotton exported from India to England was about 250,000,000 of pounds; whilst in the same period the quantity exported from India to China, &c., was about 540,000,000 pounds. On comparing together the average total quantity of cotton imported into Great Britain in the years 1830, 1840, and 1850, from the United States and from India, it will be found that whilst the former, during those three periods, has increased in about the ratio of 500,000 bales, 950,000 bales, and 1,200,000 bales, the latter has increased in the ratio of 67,000 bales, 163,000 bales, and 300,000 bales; showing, therefore, that, large as the annual increased importation of American cotton into England has been, the increased consumption of East Indian cotton has, in proportion, augmented even more rapidly.

The chief varieties of native India cotton, named according to the districts where they are produced, are the—

- |               |                |              |
|---------------|----------------|--------------|
| 1. Surat.     | 7. Berar.      | 13. Ladom.   |
| 2. Broach.    | 8. Colahatore. | 14. Agra.    |
| 3. Dharwar.   | 9. Compta.     | 15. Guzerat. |
| 4. Tinnevely. | 10. Nagpore.   | 16. Cutch.   |
| 5. Cuddapah.  | 11. Belgaum.   | 17. Concan.  |
| 6. Nellore.   | 12. Dacca.     | 18. Dacgra.  |

Of all these cottons it may be generally observed, that, though in some cases the fibre is beautifully fine, it is invariably short, generally badly cleaned, and too often injured, by careless collection, and packing, and faulty inland transit. It must be borne in mind, that these

short staple cottons of India cannot be compared with the long staple cottons of the New World; they are, in fact, quite different fibres—they must be treated in a different manner, and their uses are perfectly dissimilar. The question of how far long staple cottons can be advantageously cultivated in India is perfectly distinct from that of improving the production of short staple varieties. The real practical question to be considered is, not whether the East Indian cottons can be made to compete with the long staple American cotton, but whether, by care and attention, by judicious cultivation,—improved mechanical contrivances,—and the application of skill and perseverance, it may not be possible so to improve the common East Indian cotton as to give to it those characters and properties which will render it of more value to the manufacturer, by enabling him to use it even more largely, and with greater profit, than he is able to do at present.

On examining the samples of the native indigenous cottons of India, the chief causes of their inferiority are evident. No care or skill in the cultivation, of course, will render the fibre of short staple cotton like that of the long staple variety; but, in many cases, the fault is not the shortness of the fibre, it is, that the cotton has been ruined after it has grown and ripened: either by bad management the staple is broken, or, by exposure to the weather, and by the addition of dirt and impurity of all sorts, its value is most materially diminished. The difficulty rests not so much with the cotton as with the cultivator, and with the middleman: the indolent habits, and the dislike of the former to trouble of any sort, stand more in the way of improvement than anything else; whilst the want of proper encouragement to the native to persevere, and, in some cases, the opposition of the Brahmin, combine to prevent any real progress. In those cases where care and attention have been paid, the native cottons sent over are excellent; and there is no doubt that their value will slowly and steadily increase in the English market if the cotton be sent to market clean, and in the state in which it is gathered.

From the samples of experimental cotton, illustrative of the various attempts which have been made to introduce the cultivation of American cottons into India, it is obvious that though the introduction of Sea Island—and the other long staple American—cottons may, for the most part, be said to have failed, yet the cultivation and improvement of the New Orleans cotton in India (which, though not the *finest*, is certainly the most valuable cotton in the world), have been attended with very considerable success. The experimental cottons grown from New Orleans seed at the Government farms, from 1830 down to the present time, prove, most satisfactorily, that any quantity of good, sound, useful cotton may be imported from India; and that it only needs time and perseverance to give it a high place in the estimation of our manufacturers. Among the best specimens may be noticed the sample taken from the produce of the Government farms at Coimbatore, imported by the "Beresford" and "Colonist," and the samples of Sea Island and New Orleans cotton from the experimental farms in Mysore. The specimens of cotton grown under the directions of Dr. WIGHT (p. 882), who has done so much to improve and extend the cultivation of cotton in India, are so good, that the Jury awarded to him a Prize Medal. The cotton grown at Cuddoor by F. D. MURPLEN is so remarkable for the goodness of its staple, its cleanness, and the careful manner in which it has been handled, that the Jury deemed it worthy of Honourable Mention.

A very promising sample of cotton, grown from Pernambuco seed, on Mr. HENRI's estate at Saravak, in Borneo, is exhibited. The staple is pretty long, though a little coarse and uneven; still, it is very clean, has a good colour, and there is no doubt it would find a ready market at a fair price. The Jury awarded a Prize Medal for this cotton.

Among the good samples of well-cultivated native cottons, those of Mr. G. T. FRANKS (p. 883), of Salem, may be mentioned. The Jury deemed these samples worthy of Honourable Mention.

A good sample of Pernambuco cotton is exhibited from

Tenassarim; the staple is fair, but a little unequal: it is a good, useful cotton, and has a healthy colour.

The cotton from New Orleans seed, cultivated at Belgaum, is somewhat degenerated; it is, however, very well cleaned, in good condition, and is a good, useful cotton. Some of the samples of American cotton from Dharwar are likewise worthy of commendation.

Besides these, other good samples of cotton are contributed by private individuals; special notice must be taken of the Burmese cotton contributed by Dr. MORTON, of Moulineau (p. 882); the samples of cotton from Bagcheen, near the Chumbul River, exhibited by his Highness the MAHARAJAH JYAJEE RAO SCINDIA, of Gwalior (p. 882); the cotton contributed by his Highness the RAJAH of KOTAH, from the Rajpootana States (p. 882); and the cotton from Cutch, contributed by his Highness the RAO of Cutch (p. 882).

Mention may here be made of the very beautiful fibre of the "simool," or silk-cotton tree, *Bombax heptaphyllum*, which, owing to the shortness and want of strength of the fibre, combined with its peculiar elasticity, is incapable of being spun like ordinary cotton. It is occasionally, in India, more especially in Assam, spun into a very loose and large thread, which is then woven into cloth with a warp of some other fibre, and forms a soft, warm, and very light fabric. The silk-cotton, being a very tender fibre, cannot be used with advantage as a stuffing material alone; but it is highly probable that it might be very advantageously used in combination with other substances, not merely for purposes of upholstery, but even in the manufacture of mixed fabrics, and for various other uses in the arts. It was suggested by Dr. Percival, in 1787, and by Beckmann, in 1793, that this fibre might be advantageously employed as a substitute for beavers' fur, in hat-making; and Le Breton states that its importation into some countries was forbidden, for fear that it should be used to adulterate beavers' hair. Practical obstacles were, however, found to interfere with this application, and it appears that they have only recently been overcome.

Specimens of native, Bourbon, and Sea Island cotton, grown at Batticaloa and Jaffna, in Ceylon, are exhibited.

An interesting series of samples of cotton from Malta are exhibited by G. PULIS (p. 944), of Montebello, including Nankeen cotton, Sea Island cotton, and mastoid cotton: the latter is a fine cotton; it has a very fair staple, both strong and silky.

Very promising specimens of cotton from Port Natal are exhibited by T. BAZLEY (30 B, p. 950), and C. MANUEL, of Cape Town (11, p. 950). In both cases the staple is good, and it is evidently a fine and valuable cotton, but badly handled. To each of these exhibitors the Jury awarded a Prize Medal.

Samples of cotton from the West Coast of Africa are shown by WARWICK WESTON (1, p. 925). The staple, though short, is fine, and if well handled this would probably be a useful cotton: it was deemed worthy of Honourable Mention.

A specimen of wild cotton, collected from the banks of the Niger, is contributed by Capt. H. D. TROTTER (5, p. 953).

Three samples from Barbadoes, exhibited by A. READE (972), consisting of Persian or greenseed, common Demerara, and vine or Pernambuco cotton, are interesting; the latter very superior: they were deemed worthy of Honourable Mention.

A series of excellent cottons is contributed by different exhibitors from British Guiana. Amongst these may be mentioned fine, strong, and good-coloured Sea Island cotton from Batavia Plantation, on the river Mahaica, Demerara;—D. BLAIR (71 & 72, p. 981); for these the Jury awarded a Prize Medal.

Excellent Sea Island and other cotton is also shown by J. F. BEN (74, 76, p. 981) from Woodlands Plantation, on the river Mahaica; the staple strong and very good: for these also Honourable Mention was awarded.

Some very good samples of New Orleans and Pernambuco cotton, &c., are contributed by P. HUGHES (74 A & B, p. 981), from Anna Regina Plantation, Essequibo: for these samples Honourable Mention was awarded.

An excellent specimen of uncleaned short staple cotton from the Klein Poodaroyen Plantation, river Demerara, is exhibited by A. D. VAN DER GON NETCHER (73, p. 981): this was deemed worthy of a Prize Medal.

A good sample of New Orleans cotton grown at Blacknow, Jamaica, by W. FINLAISS (163, p. 987), was deemed worthy of Honourable Mention.

A remarkably fine specimen of Sea Island cotton is shown in the Trinidad collection. The seeds were imported from Jamaica; the produce is excellent, has a beautiful silky lustre, and is strong; it was considered worthy of Honourable Mention.

Some long, and strong, but rather coarse cotton is shown by the AGRICULTURAL SOCIETY OF ST. HELENA (2, p. 955); it is in a tolerably clean condition.

Samples of cotton from Maidland, in New South Wales, are contributed by Messrs. DUDGEON (11, p. 989).

The collection of long staple cottons from the United States is, as has already been mentioned, remarkably fine. The samples have nothing to be desired, either as to staple, handling, or packing. After a minute and careful examination of all the bales, the Jury being desirous of expressing their high appreciation of the degree of perfection to which the cultivation of this important staple has been brought in the United States, decided on recommending the award of the Council Medal to the Government of the United States (p. 1431), in testimony of the great and successful efforts made by the cotton planters of that country (see p. 69); whilst at the same time they determined to award a Prize Medal to each of the eleven following exhibitors, without attempting to draw any distinctions:—

S. BOND, of Memphis (37, pp. 1434, 1435).

W. HAMPTON, of Charleston, S. Carolina (172 B, p. 1448).

G. I. HOLMES, of Memphis, Tennessee (316, p. 1454). "Louis Prolific."

J. V. JONES, of Charleston, S. Carolina (172, p. 1448).

J. R. JONES, of Charleston, S. Carolina (172A, p. 1448).

D. LAK, of Memphis, Tennessee (330, p. 1456).

W. W. MCLEOD, of Charleston, S. Carolina (172E, p. 1448).

J. B. MERRIWEATHER, of Montgomery, Alabama (164, p. 1447).

J. NAYLOR, of Vicksburg, Missouri (178, p. 1449).

J. POPE, of Memphis (32, p. 1434). "Dimes Prolific."

W. SEABROOK, of Charleston, S. Carolina (172F, & 320B, p. 1454).

An instructive collection of small samples of cotton is contributed by TRUESDALE, JACOBS and Co., of New York (494, p. 1465); this, and also the collection of ELI RAYNER, of Tennessee, were deemed worthy of Honourable Mention.

A fine sample of long staple Peruvian cotton, of a good and useful character, is exhibited.

Specimens of uncleaned Chinese cotton, "Meenhwa," and the same cleaned, "Hwae," are contributed by H. M. CONNELL at SHANGHAI (1, p. 1418); the cotton has a good colour, and a fine silky lustre, but it is so short that it could only be used for wadding, or to mix with other cottons; it is very well cleaned.

Several good samples of cotton are shown in the Egyptian collection; of these the Mako cotton, first quality, exhibited by ABRAHAM PASHA (106, p. 1409); the Sea Island cotton, grown by T. W. LARKINS (134, p. 1409), were deemed worthy of Honourable Mention.

Some interesting and promising samples of cotton are contributed from Algeria, demonstrating in a remarkable manner the progress being made in that colony; among these, in particular, may be specified the capital Louisiana cotton from M. CHEFFART, of Birmandreis (17, p. 1240); the Jumel cotton from DUPRE de St. MAUR of ORAN (23, p. 1261); the clean, long, and useful Jumel cotton of 1850, from MORIN of EL BIAR (39, p. 1261); and the strong, fine, and well-cleaned cotton from C. PAILLIARD of Kaddou (42, p. 1261); for each of these four, the Jury awarded a Prize Medal.

The collection of cottons contributed by A. HARDY, manager of the Hamma Nursery near Algiers (28, p. 1261), is also remarkably good; including Georgia, Louisiana, Jumel, New York, Macedonia, and Nankeen cotton

of 1849 and 1850: for this the Jury awarded a Prize Medal.

Other fair samples of cotton are contributed by F. GARMA of Philippeville, Constantine (26); HALOUEH of Drariah (27, p. 1261); and M. BENES (3, p. 1259): these were deemed worthy of Honourable Mention.

Good cotton cultivated near Lisbon is contributed by A. SA NOGUEIRA (538, p. 1313): this was deemed worthy of Honourable Mention. (539) and (540) are good Brazilian cottons from Algarve; they have a long and strong fibre, but are a little coarse and wild.

In the Russian collection there are two samples of cotton: Bourbon cotton, exhibited by PRINCE NIKO DUNDIVADZE, from Iperitia (95, p. 1369); and native cotton from the district of Sharour, government of Erivan, cultivated by APOURZA-MARAH OGLI (94, p. 1369). These were both considered worthy of Honourable Mention.

A fine sample of cotton is shown by M. HURTELL (p. 1428), from the Society Islands, which was deemed worthy of Honourable Mention.

Raw cotton, the produce of the province of Seville, raised from Sea Island seed on irrigated lands, is exhibited by J. B. VILLARS of Seville (162, p. 1339); it has a fine, long, and strong staple, of a very useful character, and was therefore deemed worthy of Honourable Mention.

A valuable and interesting series of samples of cotton is shown in the TURKISH COLLECTION of raw produce from various parts of that empire. The general character of these cottons is shortness of staple, and that peculiar wild and wiry fibre which is very wasteful in the mill, and which, therefore, meets with but little approbation, generally, from our manufacturers. These cottons burn very readily, lose but little ash, and, from the peculiar character of their fibre, are remarkably fit for the manufacture of candle-wicks; they are also employed advantageously in the preparation of wadding. The sample of "Lana cardie" from Koniah (2082) is coarse, short, and wild, resembling some of the native cottons of India, it is, however, well cleaned, as in fact all the Turkish cottons are. (See p. 69.) The localities from which these specimens are contributed are as follows:—

|                  |                 |                |

#### FLAX AND HEMP.

The quantity of flax imported into Great Britain has, for a considerable number of years, been gradually increasing. Twenty years ago the annual importation was about 48,000 tons; ten years since it had increased to about 65,000 tons; and at the present time it is about 80,000 tons. The proportion per cent. of this quantity, imported from different countries, may be judged of by the following table, calculated on the average imports of the years 1840, 1844, and 1849:—

|                   | 1840 | 1844 | 1849 |
|-------------------|------|------|------|
| Russia - - -      | 69   | 7    | 74   |
| Prussia - - -     | 11   | 2    | 10   |
| Holland - - -     | 9    | 1    | 6.5  |
| Belgium - - -     | 6.5  | 7    | 4    |
| France - - -      | 3.5  | 3.5  | 1.5  |
| Other countries - | 1    | 1.5  | 4.5  |

During the last few years, great efforts have been made to extend and improve the manufacture of this valuable fibre in various parts of the world. The increase under the last head in the preceding table, for 1849, is chiefly due to the importation of flax from Egypt. It must be remembered that, in addition to the above-mentioned quantity of flax annually imported, the manufacturers of England have, on an average, rather more than a quarter as much again, cultivated in various parts of the British empire, chiefly in Ireland. This proportion has also considerably increased during the last twenty years, and a most marked

improvement in the quality of the flax itself has also been produced; a change in great measure to be traced to the persevering and most praiseworthy efforts of the Royal Society for the Promotion and Improvement of Flax in Ireland. The value of flax depends, in part, on the climate and soil in which it is cultivated; and in part, also, on the mode in which the fibre is prepared, on the care and skill with which the process is conducted, and on the constant and vigilant attention which is paid to it through the various stages of the operation. According to its quality, its value varies from about 40% to 180% per ton.

Another circumstance which has given a considerable impetus to the cultivation of flax, and is likely to produce, ere long, even yet more marked effects, is the introduction of the late R. B. Schenck's new process of steeping.

Formerly the separation of the fibre from the woody matter of the stem was effected by the process of "retting," of which there were three modifications—dew-retting, pond-retting, and river-retting. The stem of the plant consists, essentially, of two parts;—a wooden centre or core, the *shove* or *boom*,—and the external fibrous portion, which, when separated from the former, constitutes the flax. These two are cemented together by a glutinous matter, not soluble in water alone, and which must be got rid of by some means before the pure fibre can be separated from the woody shove. The old mode consisted, merely, in exposing the flax stems to air and moisture under circumstances favourable to fermentation or incipient putrefaction, so that the glutinous matter being destroyed, the fibre could then be easily separated from the shove. Whether this species of fermentation is effected by exposing the flax for some weeks to the action of the dew and rain, spread over meadows—whether it is effected by steeping it in ponds or pits of stagnant water—or, lastly, by sinking it in large wooden frames in the current of a deep and slow-flowing river; there are serious practical difficulties, which have long directed the attention of ingenious men to the possibility of discovering a new and less objectionable mode of preparing flax. During the slow retting of the flax a large quantity of certain putrid vapours is given off; the water, and the very air itself, are poisoned; and this, alone, is no trifling objection to the process. So serious an objection, indeed, have these putrid exhalations been found to the use of water-retting, that in some districts of Belgium, in Hainault and Namur especially, it is forbidden by law, as being dangerous to "public safety and the health of the inhabitants." In Flanders, however, no such laws are in force, and it is there commonly believed that dew-retted flax is, of necessity, meagre and dry. Many different modifications and peculiar modes of retting are followed in the various flax districts of Belgium, Holland, and France; and in different localities dissimilar modes of retting have long been in use, often involving very considerable variations in principle. Thus, at Courtrai, the flax crop is dried in the field and stored for some months in barns, before it undergoes the process of retting in the river Lys. In the district of Waes, it is retted immediately after being gathered, the green stems being at once thrown into pits of stagnant water. As, however, the whole operation, in every kind of water-retting, depends on the amount of fermentation produced (which must be enough to insure the decomposition of the glutinous matter, but not enough to cause any injury to the fibre), the process is necessarily slow, tedious, and very uncertain, especially towards the close of the operation, because then, the flax must be most carefully watched, in order to put a stop to the fermentation as soon as the desired effect is produced. A slight change of temperature, or a few hours' exposure, when the fermentation is complete, may produce the most disastrous effects, the fibre being in fact ruined. Dew-retting is of course even slower than water-retting; depending, as it necessarily does, on the nature of the season, and being greatly retarded by long-continued dry weather. In the very dry autumn of 1810, it was found impossible to prepare flax by this method, and recourse was obliged to be had to other methods of retting.

During the last half-century various attempts have been made to effect the separation of the fibrous from the woody portion of the flax stem by chemical and mechanical means. In several cases the results at first appeared to be very promising, but in every instance it was soon found that there were insuperable practical objections, which more than counterbalanced the advantages. Among chemical agents, solutions of sulphuric acid, caustic potash, caustic soda, quicklime, and soft soap, were all, in turn, tried and discarded; and among mechanical processes the ingenious contrivances of Mr. James Lee and Messrs. Hill and Bundy shared the same fate. Mr. Lee, having found a means of separating the fibre of flax without water-retting, and the discovery being considered one of very great importance, obtained a patent for his mechanical process in 1812, with the singular protection of a special Act of Parliament, by virtue of which he was exempted from specifying the particulars of his process during the first seven years of the duration of his patent. In 1817, and therefore before the publication of his specification, Messrs. Hill and Bundy took out their patent for machinery for breaking and preparing raw flax and hemp. The rival claims of these two inventors were investigated in 1817 by a committee of the House of Commons; but whatever may have been the comparative merit of the two processes, in the course of a very few years both were relinquished and forgotten. Since that time various other ingenious mechanical arrangements have been devised, but hitherto they have had very little success.

Schenck's process, for which he obtained a patent in 1846, is undoubtedly a very important improvement; it consists merely in steeping the flax stems in warm water, heated artificially to the temperature best suited to fermentation. By this simple means, the operation is rendered rapid and certain, all uncertainty from fluctuations in the temperature and weather is avoided, and the whole process is entirely under the command of the manufacturer. The temperature best suited for this purpose is about 80°, or from 80° to nearly 90°; above this point the process proceeds too rapidly, and the fibre is almost sure to be more or less injured. The time required is from about 70 to 90 hours.

From the facts and evidence brought forward by various independent exhibitors, it appears satisfactorily proved that the warm-water steeping increases the percentage of fibre obtained from the flax stem over that obtained by the old modes of retting by nearly one-fifth; and that, whilst the fineness and spinning qualities of the fibre are increased, the strength is in no way weakened or diminished, unless the process be permitted to proceed too far, an effect which need never happen, from the complete control over it which the manufacturer has throughout. Although there is no doubt as to the practical value of the use of warm water in flax-retting, yet the introduction of Schenck's process is far from removing all the difficulties of the flax manufacture; much still remains to be effected, and it is by no means improbable that, ere long, a yet more perfect process may be devised.

It is interesting to observe that the use of warm water in the preparation of vegetable fibre is not altogether new, it having been long employed by the Malays, and by the natives of Rungpoor, in Bengal. The process adopted at Benicoolen is stated by Dr. Campbell to consist in steeping the stems of the hemp in warm water, in which it is allowed to remain for two days and nights.

The old German process called "Molkenriest," sometimes used in preparing the finer sorts of flax, is also, to some extent, an application of the same principle. In this mode of retting, the flax was steeped for four or five days in a warm mixture of milk and water, and thus the desired degree of fermentation in the flax stems was produced. This operation must be distinguished from the more modern one, in which sour milk was used in order to give a good colour to linen, a process introduced by the Dutch towards the middle of the last century. The linen was boiled in a weak alkaline lye, and subsequently treated with sour buttermilk, for the purpose of aiding in removing the alkali, and dissolving the earthy impurities present in the fibre. Occasionally, also,

salt of sorrel was used for the same purpose; and in 1775, Reuss states, that sulphuric and muriatic acids might be used for the same purpose; but that being too costly, they had not as yet come into general use. Of course, all processes in which boiling or even hot water is used are quite different in their mode of action from those in which only warm water is employed. When boiling water is used, it is with a view of dissolving and removing the useless matters which encrust the fibrous part of the plant; whilst, on the other hand, warm water is used to soften them, and to aid in their putrefaction or decomposition, through the agency of fermentation. In 1787, much interest was excited in Ireland by the publication of a plan for improving the retting of flax by the action of hot water; in this scheme, it was proposed to scald the flax-stems in boiling water to soften them, and to remove a portion of the extraneous vegetable matters which they contain; and it was conceived that after this treatment the subsequent retting of the flax would be more rapid, certain, and manageable; so that time would be saved, the noisome process of pond-retting be obviated, and the result be to yield a stronger and whiter fibre. The minute and careful experiments of Hermbstaedt, on the chemical principles involved in the retting of flax (made about the beginning of the present century), threw much light on the whole subject, and to some extent indicated the influence of temperature on the success of the operation.

The entire collection shown by the "Royal Society for Improving and Promoting the Growth of Flax in Ireland" (106, p. 203\*) is so highly valuable, and so clearly illustrates the great advances which have already been made in these matters, and the important service which this society has already rendered to the country, that the Jury determined to mark their high appreciation of the Society's labours by the recommending the Council Medal. (See p. 69.) Among the individual specimens of particular merit may be mentioned the flax exhibited by WHITE, of Antrim, PRESTON, of Belfast, and ADAMS, of Ballyderitt, near Coleraine (49, p. 198\*): to each of these three the Jury awarded a Prize Medal.

A very useful and complete series of the principal commercial varieties of flax, hemp, and similar fibrous materials, commonly met with in the English market, is contributed by Messrs. HUTCHINSON (40, p. 197\*). The samples, which are all good, are as follows:—

| Flax.                       |  |                 |
|-----------------------------|--|-----------------|
| French flax                 |  | Riga flax.      |
| Flemish do.                 |  | English do.     |
| Dutch do.                   |  | Egyptian do.    |

For this collection the Jury awarded a Prize Medal.

A numerous series of specimens are contributed by P. CLAUSSEN (105, p. 202\*, 203\*), in illustration of his patent process of making flax cotton. This process (patented August 1856) consists essentially in boiling the cut and crushed stems of the flax, hemp, or other plant, in a dilute solution of caustic soda, containing about one two-thousandth part of alkali. The fibrous matter is then removed, and plunged into a bath of dilute sulphuric acid, containing one five-hundredth part of acid, in which it is boiled for about an hour. It is next transferred into a solution containing about ten per cent. of carbonate of soda; and lastly, when it has remained in the latter for an hour, it is plunged into a weak solution of sulphuric acid, consisting of one part of acid to two hundred or five hundred parts of water; in this it is left for about half an hour, and the process is completed. The effect of these several processes is "to divide and split up" the fibre in a most remarkable manner, so as completely to alter its character. Flax thus treated is converted into a substance very nearly resembling cotton. It is probable that flax cotton can be advantageously used in the manu-

facture of mixed fabrics, as it appears capable of being spun with wool, silk, and other fibres. It may, therefore, perhaps hereafter lead to several new and important practical applications. For this ingenious process the Jury awarded a Prize Medal.

The idea of modifying the fibre of flax and hemp, so as to convert it into a kind of cotton is by no means new. In 1747, Lilljekreuzes and Palmquist described a mode of converting flax into "cotton" by boiling it for some time in a solution of caustic potash, and subsequently washing it with soap. In 1775, considerable quantities of refuse flax and hemp were converted into "flax-cotton" by Lady Moira, with the aid of T. B. Bailey, of Hope, near Manchester. The full details of the process employed do not appear to have been published; but from Lady Moira's letters in the "Transactions of the Society of Arts for 1775," it appears that the fibre was boiled in an alkaline lye, or a solution of kelp containing carbonate of soda, and subsequently scoured. The result of this was, that "the fibres seem to be set at liberty from each other," after which it may be "carded on cotton cards." It appears that at this time "flax cotton" was made and sold at threepence a pound; and Lady Moira states that she believes that it takes colours better than flax. It is curious to observe the fate of Lady Moira's scheme: she says, "I have no reason to be vain of the samples I have sent you, they merely show that the material of flax cotton, in able hands, will bear manufacturing, though it is my ill fortune to have it discredited by the artizans who work for me. I had in Dublin, with great difficulty, a gown wove for myself, and three waistcoats; but had not the person who employed a weaver for me particularly wished to oblige me, I could not have got it accomplished; and the getting spun of an ounce of this cotton in Dublin I found impracticable; and the absurd alarm that it might injure the trade of foreign cotton had gained ground, and the spinners, for what reason I cannot comprehend, declared themselves such bitter enemies to my scheme, that they would not spin for me. Such is my fate, that what between party in the metropolis and indolence in this place (Ballynahinch), I am not capable of doing my scheme justice. That it should ever injure the trade of foreign cotton is impossible. Though long accustomed to behold shoes and stockings looked upon in this part of the world by the generality as quite unnecessary, yet I cannot think but some apparel is requisite; and as the price of wool is so high, and the poverty of the people so great, I did wish to introduce amongst them that invention which I saw might be greatly improved, and turn the refuse of flax into comfortable clothing, and by a process so easy that every industrious wife and child might prepare it." Lady Moira states, that the flax-cotton gowns which she had made, and which were worn by the members of her own family, were exceedingly durable; and the specimens of these fabrics, as well as of the flax-cotton prepared by her, which are still preserved in the Museum of the Society of Arts, &c., are highly remarkable for their beauty.

Subsequently to this, several attempts were made in Germany to convert flax into a fibre resembling cotton, which could be used, either alone or together with cotton, in the manufacture of cotton goods. In 1777, Baron Meidinger proposed to convert flax into a sort of cotton, by the action of alkaline solutions, &c. In 1780, a factory was established at Berchtholdsdorf, near Vienna, for the practical working of this process; and similar plans were subsequently brought forward by Kreutzer in 1801, Stadler and Haupfner in 1811, by Stäudt in 1816, and by several others. At the factory at Berchtholdsdorf not only was flax converted into cotton, but likewise a useful cotton-like fibre was prepared from tow and refuse flax; and the same is said to have been done by Haag, near Pressburg, in 1788, by Göthel in 1803, and Segalla in 1811. Whether these various plans failed from the effects of jealousy or opposition, like that which prevented Lady Moira from introducing her "flax-cotton" is unknown, but it does not appear that any of them were long persevered in. It is probable that in most cases the neighbouring manufacturers set themselves against the

introduction of flax-cotton; for Beckman, who speaks of its manufacture near Brunswick, states, that the work-people determined not to use the new material, though, at the same time he observes, that excellent fustians were made which could not be distinguished from those manufactured with ordinary cotton. The extreme similarity of flax-cotton to ordinary cotton is also remarked by Des Charmes (1799), who states, that if the staple is cut before it is carded, it is not possible to distinguish it from cotton, either in its raw state or when manufactured. The matter was subsequently investigated by Berthollet, by Gay Lussac, and by Giobert, who employed alternately steepings in hot solutions of soap, alkali, and sulphuric or muriatic acid. Berthollet observes that equally fine cotton is obtained from the commonest refuse tow, as from the best flax.

A good sample of well-prepared flax is exhibited by Messrs. CATON and NELSON (46, p. 198\*). It is shown not on account of superiority of fibre, but as a specimen of manipulation and treatment; it is very creditable, and was deemed worthy of Honourable Mention.

Some good samples of flax are exhibited by G. MASON (34, p. 199\*); they are, 1st, flax grown, steeped, and scutched at Yately, North Hants; flax grown in South Hants; flax grown at Cobham, in Surrey; and flax grown at Farnborough. There are likewise samples of flax scutched at Winchester County Gaol, and several specimens of tow; and the whole is illustrated by a series of models of the tools and implements used in the preparation and working of flax. This series was deemed worthy of Honourable Mention.

Some excellent specimens of yellow flax, grown at Trimmingham, in Norfolk, by Mr. WARNES,\* and some blue flax grown in Yorkshire, as well as some of the best Courtrai and Lokeren flax from Belgium, are exhibited and contrasted, both in the raw and partly manufactured states, by Messrs. HIKES and ATKINSON, of Leeds (45, p. 198\*). They are very creditable, and fully entitled to Honourable Mention. (See p. 301.)

Excellent Courtrai flax is also exhibited, for best quality and finish, by Messrs. MARSHALL,\* of Leeds (55, p. 199\*); these also are well entitled to Honourable Mention. (See p. 101.)

An interesting series of samples of flax, prepared by mechanical means alone, is exhibited by M. J. J. DONLAN (43, p. 197\*, 198\*).

A number of good samples of raw and partially-dressed flax are also shown in connexion with thread and other manufactured articles: amongst them it will be enough to mention the specimens of Devon and Dorset flax, both watered and heckled, which are contrasted with good Polish and Russian flax in the Bridport series (Class XIV., 73 to 514); the golden flax grown at Chiswick, by J. P. BULL; the flax from Ielay, grown by W. SIMMONS (pp. 510-513); the flax shown by SADLER, FENTON, and Co. (Class XIV., 18, pp. 510-513), and JAMESON and Co., of Hull (Class XIV. 60); all of which, as well as the samples of flax from West Chinnock, in Somerset, shown by R. HAYWARD (Class XIV., 44, p. 512), and those from Crewkerne, shown\* by P. LOVELESS and by J. Brooks of Dinnington, are excellent.

Some good samples of hemp, accompanied by cloth manufactured from it in the Himalayas, are shown in the valuable collection of East Indian fibres.

Samples of Canadian flax are exhibited by M. BASTEN, of St. Rise (70, p. 963), and of hemp, by F. GRICE, of Montreal (71, p. 963). In both cases the quality of the fibre is good, but its preparation is faulty and objectionable; with a little more care the value of each would be considerably increased: they were both deemed worthy of Honourable Mention.

\* A good specimen of flax from Van Diemen's Land is exhibited by J. DIXON, of Skelton Castle, Iain (19, p. 99), and by F. LIPSCOMB\* (174, p. 995); these were both deemed worthy of Honourable Mention.

A few small samples of flax and hemp from the United States are contributed by E. R. DIX, of Vernon, New York (139, p. 1441). They are of fair average quality, but

\* \* \* Awarded a Prize Medal by Jury of Class XIV.

not remarkably fine; they were, however, deemed worthy of Honourable Mention.

Fine samples of strong and well-prepared flax are shown from the **FLAX SPINNING MILLS** of Schönberg, in Moravia (95, p. 1012), by **JACOB BIRNBAUM** (95, p. 1612), and from the **PATENT FLAX-RETTING ESTABLISHMENT** at Ul-lerdorf, also in Moravia (96, p. 1012), the latter including raw flax—the same water-retted—and heckled flax. A Prize Medal was awarded to each of these three series.

The samples of Belgian flax are, as might be expected, excellent, and well sustain the high and acknowledged reputation which it has long enjoyed. Several of the specimens shown are remarkably strong, fine, and mellow. In particular, the Jury would specify the flax shown by **DAVID and DE BOE**, of Antwerp (98, p. 1154); **DESMET and Co.**, of East Flanders (104, p. 1154); **J. B. VAN BOGAERT**, of Grimbergen, in East Flanders (107, p. 1154), who also shows some excellent hemp. **P. J. VERBECK**, of Grimbergen (113, p. 1154), and **J. B. VAN WIRLE**, also of Grimbergen, in East Flanders (114, p. 1154), who contributes pound-retted flax of 1850. To each of these five the Jury awarded a Prize Medal.

Fine samples of flax are also exhibited by **DEGRAEVE-DELPORTERIE**, of Ghelueve, West Flanders (90, p. 1154); **F. LECLERCQ**, of Longchamp, Namur (88, p. 1154); **F. VERCANYSSE**, of Dewbyck, near Courtrai; and **J. C. VAN ACKERE**, of Wevelghem, in West Flanders (215, p. 1154-1158); these were deemed worthy of Honourable Mention.

Several good specimens of flax in its various stages of preparation are likewise contributed by **ROELS and Co.**, of Loketen (83, p. 1154); **DE M. LAVIOLETTE**, of Bruges (96, p. 1154); **S. P. VAN HONY**, of Hamme, in East Flanders (106, p. 1455); **B. HAERE**, of West Flanders (115, p. 1154); and by the **FLAX COMPANY OF GHENT** (230).

Among the samples of Belgian hemp, those of **F. VERHELST**, of Grimbergen, in East Flanders (103, p. 1159); **PIERRE JEAN VAN RIET**, of Moerzeke, in East Flanders (103, p. 1154); and **J. L. GILTA**, of Appels, in East Flanders (108, p. 1154), were deemed the best: the Jury awarded a Prize Medal to each of these three.

In the **EGYPTIAN COLLECTION** of raw produce, several specimens of flax and hemp are shown. The flax of **Phoum** (107, p. 1409), that from **Menauf** (108, p. 1409), and the sample of hemp (152, p. 1409), were deemed worthy of Honourable Mention.

Very superior flax and hemp are contributed by some French exhibitors, especially from the Northern Departments. Among the exhibitors of flax may be specified **L. DUMORTIER**, of Bourbecque, near Lille (177, p. 1182), who shows flax of the year 1849, retted in the river Lys. **F. ROUXEL**, of St. Briex (362, p. 1174); **JOUBERT BONNAIRE**, and **Co.**, of Angers (552, p. 1205), who also show excellent hemp; and **E. H. LAILLIER** (559, p. 1205); to each of these four, severally, the Jury awarded a Prize Medal.

Among the French exhibitors of hemp, those deserving of special notice are **MESSTRS. BERNARD, RICHOUX**, and **GENEST**, of Angers (61, p. 1174). **LAINÉ LAROCHE**, and **MAX-RICHARD**, of Angers (286, p. 1190); and **LECLERC BROTHERS**, also of Angers (576, p. 1205); to each of these three the Jury awarded Prize Medals.

In the **Zollverein** collection, the samples particularly deserving notice are those shown by **A. RÜFIN**, of Rüstern, Liegnitz (34, p. 1049), specimens of flax swirled in the Belgian method, by the **BARON VON LÜTTWITZ** of Simmenau, near Ippeln (42, p. 1050); and **G. MEVSEN**, of Dülken, near Düsseldorf (557, p. 1082): to these three the Jury awarded Prize Medals.

The samples of flax contributed by **K. F. ELMENDORF**, of Isselhorst, near Bielsfeld (470, p. 1078); **KÖNIGS** and **BUECKLERS**, of Dülken, near Düsseldorf (552, p. 1081); **A. BRUNGER**, of Jüllenbeck, near Bielsfeld (559, p. 1082); and **C. E. HONIG**, of Brunswick (723, p. 1090); and **P. OLLERDMANN**, of Urentrup, near Bielsfeld (551, p. 1081); were severally deemed worthy of Honourable Mention.

A good sample of hemp is exhibited by the **LANDWIRTSCHAFTLICHER VEREIN**, at Sangerhausen.

Some samples of well-prepared flax are also exhibited from Saxony: those exhibited by **C. SOMMER**, of Sornzig, near Mügen (1, p. 1104), **J. WATTFRE**, of Lichtenburg, near Freiburg (3, p. 1104), and **W. GAETZSCHMANN**, of Zittau (3, p. 1104), were deemed worthy of Honourable Mention.

Specimens of flax and hemp prepared in a peculiar manner, are shown by **S. L. SWAAB**, of the Hague (50, p. 1145).

In the Portuguese collection, there are several specimens of both flax and hemp. The hemp from Catharia, exhibited by the **DUKE DE PALMELLA** (530, Class I. and II., p. 4330), shown both in the state of dried stems and partially dressed, was deemed worthy of Honourable Mention.

Several specimens of flax and hemp from Rome are also shown. A sample of Centese hemp, contributed by the **CHAMBER OF COMMERCE** of the city of Cento (9, p. 1285), was deemed worthy of Honourable Mention.

Hemp is also exhibited from Bologna by the **COUNT BIANCONCINI** (4, p. 1285), and by **MARCO MINGHETTI** (10, p. 1285).

A large and important series of flax and hemp samples is shown in the Russian collection of raw produce, and several of them are capital specimens. The flax is in considerable variety—from fine and silky, down to coarse and wiry; some of the specimens are a little unequal and irregular. Among the best may be mentioned those of **ARDAMATSKY BROTHERS**, from the government and district of Novgorod (99, p. 1069); **E. KARNOVITCH**, from the government of Jaroslaff (101, p. 1367); and those from **VALK**, in the district of Viñsk, government of Esthonia (106, p. 1369); some of the latter, in particular, are especially fine. The Jury awarded Prize Medals for these three.

Some excellent flax is also exhibited by **MICHAEL BABARIKIN**, of Kholm, in the government of Pskoff (96, p. 1369); from the **FARM OF GOMGORETZK**, in the government of Mohiloff (121, p. 1370); **CLARKE, MORGAN**, and **Co.**, government of Vologda (114, p. 1370); **S. ZAKHAROFF**, of Kholm, in the government of Pskoff (108, p. 1370); and **KOSMA MILOKROSHETCHNOI**, of Pudjoi (110, p. 1370). The samples from these five exhibitors were deemed worthy of Honourable Mention.

Good specimens of flax are also contributed by **JOHN and THEODORE ARDAMATSKY**, of Soletz, in the government of Pskoff (97, p. 1369); **JOHN ARDAMATSKY**, of Porkoff, in the government of Pskoff (98, p. 1369); **MELNIKOFF**, of Melenkoff, in the government of Vladimir (111, p. 1370). **THEODORE VANINKOFF**, of Soletz, government of Pskoff (112, p. 1370); and the **VELIKOE ESTATE**, in the government of Jaroslaff (105, p. 1369).

Of the samples of Russian hemp, the best are those exhibited by **KRASHENENKOFF**, from the district of Sevsk, government of Orel (100, p. 1369); **KOSMA FILMONOFF**, of Rilsk, government of Jaroslaff (103, p. 1369); and the **PRINCE VOLKONSKY**, from the district of Sevok, government of Orel (109, p. 1370). For each of these three series a Prize Medal was awarded by the Jury.

Very good samples of flax and hemp are exhibited in the Spanish Department of raw produce; among the best are the flax contributed by **F. A. VALGOMA**, of Cacabelos, Leon (98, pp. 1334, 1335); the **PROVINCE OF HUESCA** (158, p. 1339); and by **P. DE LAS HERAS**, of Segovia (161, p. 1339). These were severally deemed worthy of Honourable Mention.

Good specimens of flax are also contributed by **J. M. CALDERON**, of Grenada (152, p. 1338); **J. PINAN**, of Leon (159, p. 1339); flax from Galateras, and **Vega de Monasterio**, by **DE LAS HERAS**, of Zamora (91, p. 1339); flax from Camaruna, and Puebla de Sanabria (91, p. 1334); and by **DE LAS HERAS**, of Saragossa; flax from Borja (p. 1339).

The best samples of Spanish hemp are those exhibited by **J. M. CALDERON**, of Grenada (152, p. 1338); **P. MARTÍNEZ**, of Valencia (156, p. 1338); and by **COUNT RIPALDA**, from Valencia (163, p. 1339). For each of these three samples, the Jury awarded a Prize Medal.

A very excellent specimen of strong, though somewhat coarse hemp, is also shown by **A. DRES-DE RIVERA**, of Grenada (172, p. 1339); this was deemed worthy of Honourable Mention.

Samples of hemp are contributed likewise by the Municipal Corporation of Castellón (183, p. 1338); D. De Mureia (154, p. 1338); D. De Saragossa (155, p. 1338).

Some interesting samples of water-retted flax from Angermaland, in the north of Sweden, are exhibited by JOHAN JOHANSSON (21, p. 1350). The flax is of very good quality, though not well manufactured; it was however deemed worthy of Honourable Mention.

In the Turkish collection, six samples of flax and two of hemp are exhibited; the latter are from Djanik, and Wallachia; the former from Endemith, Djanik, Unia, Aidin, Drama, and Wallachia.

## MISCELLANEOUS FIBRES.

In the various collections of raw produce, a very large number of other fibrous substances, used as substitutes for cotton, flax, and hemp, are shown; some of these are new or but little known, and among them are several which, from their valuable properties, seem likely, ere long, to become important articles of trade, and not merely to form excellent substitutes for the substances already employed by manufacturers, but even in some cases to lead to the development of new branches of industry.

An interesting series of hemp, flax, and other fibrous substances is contained in the Liverpool collection of imports, these include—

|                     |       |                      |                            | 1849        | 1850   |

| 19. Spanish moss    | - - - | Tillandsia usneoides | - - - Brazil               | "           | "      |
| 20. Vegetable Silk  | - - - | Chorisa speciosa     | - - -                      | "           | "      |

Samples of flax from Holland, Belgium, France, and Russia are shown in the Hull collection of imports, and the quantity of flax imported annually is stated to be about 310,000 cwts. Specimens of hemp are exhibited also from Prussia and Italy, the yearly import of which is about 55,000 cwts.; and samples of East Indian hemp, Manila hemp, and jute; of the latter, about 1,100 cwts. are annually imported.

Amongst fibrous materials, one of the most interesting is the "China-grass," of which numerous specimens are exhibited in various departments of the Building, some of the most complete and valuable series being in the English Gallery.

Although China-grass fibre is comparatively a new material in the hands of our manufacturers, yet it has been known to men of science for a very considerable time; but certain practical difficulties have hitherto prevented it from being usefully and profitably employed. China-grass fibre is obtained from *Urtica nivea*, abundant in China and in various parts of the Indian empire, where it has long been used by the natives, who by the simple maceration of the plants, obtain from them a strong and very useful fibre. Of the various fibres examined by Dr. Roxburgh, at the commencement of the present century, with a view to the discovery of some cheap and good substitute for hemp, one of the most promising was the "Callooe" hemp, "Kaukhura," or the "Ramy," of the Islands and Malay peninsula. This was found to be the produce of an *Urtica*, to which he gave the name of *U. tenacissima*. The plant was introduced in 1803, from Benocoolen to Calcutta, where it was cultivated for several years in the Botanic Garden, then under the charge of Dr. Roxburgh. A considerable quantity of Callooe hemp having been imported into England in 1814, its practical value was tested by some competent authorities; and as the reports were highly favourable as to its strength and other valuable qualities, the Society for the Encouragement of Arts and Manufactures awarded a silver medal to Captain Joseph Cotton, of the East India Company, for

its introduction. The chief obstacle which interfered, however, with its use, was the difficulty which was found to exist in the preparation of the fibre from the stems of the plants; none of the processes usually adopted with flax or hemp were found to be at all suitable to them; and the rude, wasteful, and imperfect means employed by the natives in preparing the fibre for the manufacture of twine, thread, and fishing-nets, by the mere process of scraping, were wholly inapplicable on a large scale, and gave, besides, only a very inferior result. When macerated or retted in water, it was found that the fibre itself was more easily destroyed than the glutinous matter of the stem. It was hoped that the introduction of the machines of Mr. Lee, and of Messrs. Hill and Bundy, already referred to (see p. 97), would have obviated this difficulty; but such did not prove to be the case.

During the last forty years, various attempts have been made to devise a good and cheap process for preparing this fibre, but hitherto without much success; and consequently, till quite recently, the cost of the fibre was such as to preclude its being brought into the market as a substitute for flax. But recent investigations have shown that the *Urtica tenacissima* and the *heterophylla* may be obtained, in almost unlimited quantities, in various parts of India; and a process, which has lately been patented, appears, to a very great extent, to have removed the practical difficulties which previously stood in the way of its employment by manufacturers; so that in a few years it is probable that the Callooe hemp will constitute an important addition to the fibrous materials employed in the arts.

The process of Messrs. L. W. WRIGHT and Co., for the preparation of China-grass, &c., for which a patent was obtained in 1849, consists, essentially, in a very ingenious arrangement for boiling the stems in an alkaline solution, after they have previously been steeped for 24 hours in cold water, and for 24 hours in water of a temperature of 90°. The fibre is then thoroughly washed with pure water, and finally subjected to the action of a current of

high-pressure steam till nearly dry. A very beautiful series of specimens illustrating the preparation of this fibre, the various stages of the process, the bleaching of it, and the uses to which it may be applied, both alone and in conjunction with other fibrous materials in the formation of mixed fabrics, is shown by Messrs. WRIGHT (42, p. 197\*). For these the Jury awarded a Prize Medal.

Very beautiful samples of China-grass fibre are likewise shown by Messrs. HIVE and ATKINSON\* (45, p. 198\*), already mentioned as exhibiting superior samples of flax. For these two series the Jury awarded a Prize Medal.

Equally fine specimens are exhibited by Messrs. MARSHALL and Co.,\* of Leeds (55, p. 199\*), whose samples of flax have already been alluded to. For these samples also the Jury awarded a Prize Medal.

A valuable and instructive series of samples of New Zealand flax is contributed by E. W. TRENT (41, p. 197\*), in illustration of its manufacture and uses. It is stated that the flax is prepared from the leaves of the *Phormium tenax*, without any process of steeping, and by a simple mechanical process, which the exhibitor suggests might be advantageously carried on in New Zealand itself. This series was deemed worthy of Honourable Mention.

Some interesting specimens, showing the native manufacture of New Zealand flax, are likewise exhibited by Mr. H. A. NEW ZEALAND CHIEF (44, p. 198\*). The flax is prepared for weaving, by soaking it for two days in water, twisting it into hanks, and then beating it with a mallet on a stone. This series was deemed worthy of Honourable Mention.

Good specimens of cocoa-nut fibre are shown in illustration of the various purposes to which it is now extensively applied, by J. BARNHAM (56, p. 199\*), and by WILDEY and Co. (Class XXVIII., 40, p. 780).

In this department of raw produce, as in most others, the East Indian collection is peculiarly rich, very interesting varieties of vegetable fibres being exhibited (pp. 382-384). The old investigations of Dr. Roxburgh, in the beginning of the present century, already referred to, are of much importance in connexion with this subject; and it is remarkable that though the value of some of these Indian fibres was well known to him, and that he repeatedly sent samples of them to this country, they have never received that attention from practical men which they certainly deserved, with the exception of one or two that have long since become considerable articles of import. Of these, we may instance the jute, the fibre of the *Corchorus capsularis*, and *C. olitorius*, of which, as has just been stated, more than ten thousand tons are annually imported into Liverpool alone. The following Table shows the comparative strength of several of these East Indian fibres, as ascertained by Dr. Roxburgh; but it must be borne in mind, that, in several instances, the fibres had evidently been very rudely and imperfectly prepared: the experiments were made in 1804.

|                          |                                | Breaking Weight. |
|--------------------------|--------------------------------|------------------|
| 1. Hemp (English) -      | <i>Cannabis sativa</i> -       | 105              |
| 2. Murga (Sansevieria) - | <i>Aletris nervosa</i> -       | 120              |
| 3. Adoo -                | <i>Agave americana</i> -       | 110              |
| 4. Fjoo -                | <i>Segnerus Rumphii</i> -      | 96               |
| 5. Donsha -              | <i>Eschynomone cannabina</i> - | 88               |
| 6. Coir -                | <i>Cocos nucifera</i> -        | 87               |
| 7. Hemp (Indian) -       | <i>Cannabis sativa</i> -       | 74               |
| 8. Woollet comal -       | <i>Abroma Augusta</i> -        | 74               |
| 9. -                     | <i>Bambusa</i> -               | 69               |
| 10. Sunn -               | <i>Crotalaria juncea</i> -     | 68               |
| 11. Bungli paat -        | <i>Corchorus olitorius</i> -   | 68               |
| 12. Ghu nala paat -      | <i>capsularis</i> -            | 67               |
| 13. -                    | <i>Hibiscus manihot</i> -      | 61               |
| 14. Flax (Indian) -      | <i>Linum usitatissimum</i> -   | 39               |

It is evident, however, that these experiments could not be regarded as giving at all accurate comparative results; they only proved that many of the fibres were very strong, and well merited further trials. In 1808, Dr. Roxburgh

\* Awarded also by the Jury of Class XIV.

made a second series of similar experiments, the results of several of which were as follows:—

|                      |                                | Breaking Weight. |
|----------------------|--------------------------------|------------------|
| 1. Bow-string hemp - | <i>Asclepias</i> sp. -         | 174              |
| 2. Callooe hemp -    | <i>Urtica tenacissima</i> -    | 240              |
| 3. -                 | <i>Corchorus capsularis</i> -  | 164              |
| 4. Sunn -            | <i>Crotalaria juncea</i> -     | 160              |
| 5. Hemp (Indian) -   | <i>Cannabis sativa</i> -       | 158              |
| 6. Doncha -          | <i>Eschynomone cannabina</i> - | 156              |
| 7. -                 | <i>Hibiscus strictus</i> -     | 128              |
| 8. Musta paat -      | <i>cannabinus</i> -            | 115              |
| 9. Bungli paat -     | <i>Corchorus olitorius</i> -   | 113              |
| 10. Plantain -       | <i>Musa</i> -                  | 79               |

It is plain that the strength of all these fibres was ascertained under very unfavourable circumstances, and there is no doubt that they would have been found even yet more valuable had they been well and properly prepared. The principal vegetable fibres contributed from India are the following:—

1. "Callooe," "Rhea," or "China-grass," the fibre of *Urtica tenacissima*, and one of two other varieties of *Urtica*, already mentioned as well known in commerce under the name of "China-grass." Strictly speaking, it is probable that China-grass and Callooe hemp, are the produce of two distinct species of *Urtica*, though the fibre of the two is very similar, and, for all practical purposes, in fact identical. China-grass, as it is most commonly called, is the produce of the *Urtica* (*Boehmeria*) *nivea* of Willdenow, whilst the Callooe, Kalmoi, or Rami of Sumatra, is obtained from the *Urtica* (*Boehmeria*) *tenacissima* of Roxburgh. It is from this latter plant, also, that the Rhea of Assam is procured. The plants yielding this beautiful fibre are very abundant in many parts of the empire, and may be had in almost unlimited quantities. In the form of hemp, and when the fibre is well prepared, it is remarkably strong, and when thoroughly bleached, though the strength is then somewhat diminished, it acquires a most remarkably beautiful white silky lustre. Various specimens of this fibre are contributed from different parts of India; from Calcutta; from Assam, by Major HANNAY; from BAROO DEONATH, and BAROO LAKENATH (pp. 882-884), from Rungpore, in the district of Moorshedabad, &c., and from Singapore: these the Jury deemed severally worthy of Honourable Mention. Some interesting samples of the fibre of the *Urtica heterophylla* are contributed by Mr. THOMAS (pp. 882-884); this plant is abundant in Mysore, and especially in the Neilgherries, flourishing in Alpine jungles: unfortunately, it is one of the most highly venomous of all the nettle tribe. It is stated that the Todavars prepare the fibre of this plant by boiling the stems in water, after which, they readily separate it from the woody parts, and then spin it into a coarse but very strong thread. The Malays simply steep the stems in water for ten or twelve days, after which they are so much softened, that the outer fibrous portion is easily peeled off.

2. "Yereum nar." The fibres of the *Calotropis* (*Asclepias*) *gigantea*, a plant which grows wild, abundantly, in various parts of the Bengal and Madras Presidencies, and is used by the natives in the manufacture of cord, called "Lamb-dore," or "Toondee coir." The fibre is of very remarkable strength: from some recent experiments made by Dr. Wight, its tenacity, as compared with some of the other Indian fibres when made into ropes, is as follows:—

|                    |                                | Breaking Weight. |
|--------------------|--------------------------------|------------------|
| 1. Yereum nar -    | <i>Calotropis gigantea</i> -   | 174              |
| 2. Jambum -        | <i>Crotalaria juncea</i> -     | 407              |
| 3. Cutthaley nar - | <i>Agave Americana</i> -       | 362              |
| 4. Cotton -        | <i>Gossypium herbaceum</i> -   | 346              |
| 5. Marool -        | <i>Sansevieria zeylanica</i> - | 315              |
| 6. Pooley mungu -  | <i>Hibiscus cannabinus</i> -   | 290              |
| 7. Coir -          | <i>Cocos nucifera</i> -        | 224              |

Specimens of the *Tecoma*, or fibre of *Asclepias gigantea* (and of the Tongooos, and of the *Asclepias tenuicostata*), or bow-string hemp of Rajmahal, are sent from Coimbatore, and other districts in the Madras Presidency.

8. "Umbafce," or "Maastee pat;" the fibre of the *Palungoo*, or *Hibiscus canabinus*, a plant common all over India, and cultivated in many parts for the sake of its fibre. The process, generally adopted, seems to be that of steeping the stems in water till putrefaction commences, when they are taken out washed, and beaten until the fibre separates from the woody portion of the stem: this fibre is contributed from Madras.

4. "Marool," or "Moorva;" bow-string hemp, obtained from the *Sansevieria zeylanica*, a plant abundant in the southern parts of the continent of India, sent from Cuttack, Coimbatore, and other districts in the Madras Presidency: a good specimen is exhibited by F. LIMA (pp. 882-884).

5. "Jute," or "Pat," &c., the fibre of various species of *Corchorus*, especially *C. olitorius*, well known in commerce, one variety of it having been formerly called Chinese hemp. Many different samples of this fibre are contributed from Calcutta and from Madras. From Hongpore, in the district of Moorshedabad, samples of three varieties of jute are sent, called Sufled Hemouty Pat, Lall Hemouty Pat, and Lall Petrie Pat.

6. "Sunn," "Janapam," Indian hemp; the fibre of the *Crotalaria juncea*, likewise well known in commerce. Good samples are contributed from Coimbatore, &c.

7. "Dhuncha," or "Danche," obtained from the *Aschynomene canabina*, used by the natives of Bengal to make fishing-nets; a remarkably strong though rather harsh fibre, pretty well known in commerce. The plant is commonly cultivated in Bengal: good specimens, accompanied by cordage and rope manufactured from it, are exhibited by Messrs. THOMPSON of Calcutta (p. 884): these were deemed worthy of Honourable Mention.

8. "Coir;" the fibrous part of the husk of the cocoa-nut, *Cocos nucifera*, well known in commerce: good samples are sent from Calicut.

9. Nar, or aloe fibre, the produce of the *Agave vivipara*, and other allied species. A valuable and strong fibre is prepared in many parts of India, from different species of aloe. A very interesting series of these fibres, which are obtained from the large Hill aloe, and from the small aloe, illustrating the preparation of the fibre, exhibiting some of the uses to which it is applicable, and showing the facility with which it may be dyed of various colours, is contributed by Dr. HUNTER of Madras (pp. 882-884), who has also added many other valuable specimens to the Indian collection of fibrous materials. For these the Jury awarded to him a Prize Medal.

10. Specimens of aloe fibre are contributed from various parts of the Madras Presidency—Madras, Madurai, Coimbatore, &c., and from Singapore.

11. Yucca fibre, obtained from *Yucca gloriosa*, is also sent from Madras, by Dr. HUNTER (pp. 882-884).

12. Ejoo, or Gommuti, obtained from the *Arenia saccharifera* (*Saguerus Rumphii*), or Gommuttee Palm, much esteemed in the Eastern Archipelago for making ropes and cables, in consequence of its extraordinary elasticity and durability in water; unfortunately, the value of this fibre is greatly diminished by its peculiar fragility. Very good samples of this fibre are contributed by TAN KIM SENG, of Singapore (pp. 882-884): these were deemed worthy of Honourable Mention.

13. Putwa, or Mawal fibre, obtained from the *Bauhinia racemosa*, a plant common throughout the lesser hills of India, contributed from Bhaugulpore in the division of Patna.

14. Talli Nanas, fibre of the pine-apple, *Bromelia ananas*, from various localities. Good samples are exhibited from Madras, by F. LIMA (pp. 882-884), and Dr. HUNTER (pp. 882-884); from Singapore by Captain H. MAN (pp. 882-884), from Travancore, &c. Some very beautiful specimens of fibre, called "ananas flax," are exhibited from Java, by P. WEBER (pp. 882-884): the nature of this fibre does not seem to be very certain, for though from its name it might be supposed to be

pine-apple fibre, it more closely resembles that of the *Urtica*, or *Boehmeria*, already mentioned. It is so remarkably fine that the Jury awarded a Prize Medal to Mr. WEBER for it.

15. Plantain fibre, and Manila hemp, obtained from the *Musa textilis* and *M. paradisiaca*, contributed from Madras, from Daoga, and by the Rev. M. STOKES, from Chittagong (pp. 882-884). Excellent canuas and ropes are shown, made of this fibre, which is extensively used in the Government establishments at Ceylon.

16. Marsdenia fibre, obtained from the *Marsdenia Roylii*, and contributed by his Highness the MAHARAJA of NEPAL (pp. 882-884).

17. Pulas, fibre of the *Butea frondosa*, used for making common cordage, from Beerbhoom, in the division of Moorshedabad.

18. Parkinsonia fibre, obtained from the stems of *Parkinsonia aculeata*, introduced from the West Indies, sent by Mr. ALLAN, from Madras (pp. 882-884); said to be well suited for the manufacture of paper.

19. Roxburghia fibre, obtained from the *Roxburghia glaucoidea*.

20. Artocarpus fibre, obtained from an *Artocarpus*: this and the preceding fibre are contributed by Mr. SIMONS, from Assam (pp. 882-884).

21. Trap fibre, obtained from the bark of the trap tree, a species of *Artocarpus*, contributed from Singapore.

22. Trophis fibre, from the *Trophis aspera*.

23. Daphne bark, the fibrous bark of the *Daphne cannabina*, used in the manufacture of Nepal paper.

Besides these, several other fibrous substances from different parts of India are exhibited, such as the fibres of the *Palmyra* leaf, *Borassus flabelliformis*, from Madras, the bark of the *Bassia* tree, contributed by Captain LEXNOLDS (pp. 882-884), and a series of vegetable fibres from Arracan, called Thung-han-shaw, Pathayon-shaw, Shaw-phyo, Ngan-toung-shaw, Shaw-me, and Ec-gywo-shaw, &c., which are Honourably Mentioned.

Several of the Indian fibres, already mentioned, are also contributed from Ceylon. Good samples are shown, both as mere fibres, and also in the various states of thread, rope, and coarse cloths; of coir, aloe flax, and the fibre of the Plantain, *Hibiscus*, and *Sansevieria*.

Specimens of aloe fibre are contributed from the Cape of Good Hope by C. WATERMEYER, of Green Point (17, p. 911).

Aloe fibre, obtained from the *Agave Americana* and *A. vivipara*, has been also sent from Barbadoes.

From St. Vincent, samples of the "Mahant" bark in its raw state, the fibrous part in the state in which it is employed in the manufacture of fishing-nets, and samples of lapeto, used also in the manufacture of common cord and coarse laces for fishing nets, are exhibited by G. BULLOCK, of St. Vincent (p. 975).

Several interesting specimens of various fibres are shown in the collection from British Guiana: amongst these are specimens of silk-cotton, obtained from the *Bombax ceiba*, from George Town, Demerara, said to be exported to the United States, and used in the manufacture of hats. Exhibited by E. C. ROSS (76A and 76B, p. 981).

Plantain fibre, *Musa paradisiaca* and *M. sapientum*, from Plantation Vigilance, East Coast, Demerara, exhibited by W. DAVIDSON (77, p. 981); and from Plantation Klein, Powderoyen River, Demerara, exhibited by A. D. VAN DER G. NETSCHER (78, p. 982). It is calculated that about 8 cwt. per acre of this excellent fibre might be obtained: at present very little of it is used. It is worthy of remark that, in some of the first lists of premiums offered by the Society of Arts, about 1762, special attention was drawn to the beautiful fibre of the plantain:—"Whereas the stem of the Asiatic and American fruit-bearing plantain affords three sorts of fibrous materials which resemble hemp, hard silk, and cotton, all which have been experimentally found capable of being wrought into various sorts of manufactures; and, among others, into cordage, fustians, laces, knitting, gauze, blonde lace, and excellent candle-wicks, among specimens of which manufactures may be seen in the hands of the Registrar of the Society," &c. This advertisement was

continued for several successive years, but as no candidate came forward to claim the offered reward, it was at last discontinued.

Silk-grass fibre, the fibre of the *Agave vivipara*, from Plantation Vigilance, East Coast, Demerara; and Fihiri fibre, obtained from the Ita palm, *Mauritia farouea*, from the River Berbice, are exhibited by T. B. DUGGIN (80 and 81, p. 982).

Mohoe or Mahoe-fibre, *Hibiscus obtus* or *Thespesia populnea*, from Demerara, is exhibited by J. F. BEE (82, p. 982). It is a very strong but coarse fibre, used for making cordage, coffee-bags, &c.

Some good samples of Yucca hemp, together with a leaf of the *Yucca serrulata*, from which it is obtained, and rope and cordage manufactured from it, are shown by J. T. THOMPSON, of Nassau, Bahamas (p. 976); also specimens of the fibre of the Palmetto, and of rope made from it. These were deemed worthy of Honourable Mention.

In the Trinidad collection are some specimens of the fibre of the pine-apple and aloe; and also of the fibre of the Mahagua, or Mayagua, *Sterculia coriaria*.

Specimens of the leaf and fibre of the *Doryanthes erceles* are contributed from New South Wales by Sir T. L. MITCHELL (p. 990), as well as some rope made of the latter. These were deemed worthy of Honourable Mention.

Some good samples of New Zealand flax, *Phormium tenax*, are contributed by various exhibitors. Amongst others, by TAO NUI, a New Zealand Chief (44, p. 198\*); New Zealand flax, as prepared by the natives, by Rev. J. COLLINSON (3, p. 1000); J. ROBERTSON (4, p. 1001); J. CARADUS (25, p. 1002); and L. TARNEL (1 and 28, pp. 1000 and 1002); New Zealand flax, cleaned and prepared by machinery, exhibited by WHITLAW & SON (34, p. 1002). Each of these exhibitors was deemed worthy of Honourable Mention.

A bale of "New Orleans moss," *Tillandsia usneoides*, prepared as a substitute for horse-hair, &c., as a stuffing material for upholstery purposes, is exhibited by G. HICKS (539, p. 1469). This substance possesses considerable elasticity, and appears to be very well adapted for the above-mentioned purpose: it is stated that it may be had in any quantity, and at a comparatively small price. The Jury awarded a Prize Medal for this fibre, which, though not altogether new in the London market, does not appear so well known as it deserves to be.

A sample of the fibrous husks of the maize, or Indian corn, also used for stuffing mattresses, is shown by F. O. KERRIDGE, of Mount Vernon, New Hampshire (253, p. 1452). This substance, though not so good as the "New Orleans moss," being much more brittle and less elastic, was deemed worthy of Honourable Mention.

In the Austrian collection, specimens of fibrous wood divided into very thin and slender strips, and used instead of straw in the manufacture of a sort of plaited work, are shown by S. TANDLER, of Zinnwald, near Toplitz, in Bohemia (657, p. 1031). A Prize Medal was awarded for this ingenious application.

A specimen of *Cynurus cristatus* is shown by L. VANDEN ALWEL, of Appels, West Flanders (p. 1153). This also was deemed deserving of Honourable Mention.

Samples of China-grass, or nettle-fibre, *Urtica (Rochmeria) nitida*, from China, are exhibited by C. M. COPLAND (pp. 1421, 1422), and by Mrs. RAWSON (p. 1424).

A good fibre, prepared from the date palm (132), together with rope, string, nets, and brushes made from the fibres, are contributed from Broulos, Ghizeh, and other places in Egypt.

A useful fibrous material, proposed as a substitute for animal hair, and also for other purposes, obtained from the dwarf palm of Algeria, is exhibited by AVERSSING & Co., of Toulouse, in the Algerian collection (3, p. 1259). The Jury awarded a Prize Medal for the introduction of this substance.

A new fibrous material, proposed for wadding, for clothing, and for upholstery work, in stuffing mattresses, &c., is exhibited by C. G. FARIAN, of Humboldtaw, near Bremen (48, p. 1004). This substance, which is called "pine wool," is prepared from the leaves or sheaths of

pine trees: it is soft and somewhat elastic, though the fibre is very weak, so that it would perhaps soon mat or felt together in mattresses. It has been found to be very cleanly, and peculiarly free from the attacks of insects, and might probably be advantageously employed, mixed with some stronger and more elastic fibre. The Jury awarded a Prize Medal for this substance.

A good sample of aloe fibre, prepared from the *Agave Americana*, is exhibited by the MARQUIS DE FIDALGO (Portugal, 535, p. 1313). This was deemed worthy of Honourable Mention.

Specimens of flax, cotton, pita, or aloe fibre, and mallow fibre, are contributed from Madeira.

A fine and very beautiful fibrous material, called "Rejugo," is exhibited from the island of Luzon by the ECONOMIC SOCIETY OF MANILLA (234, p. 1544). This substance is very strong, and is used in the manufacture of plaited work, and a sort of cloth remarkable for its strength and softness. The Jury awarded a Prize Medal for it.

Specimens of several of the textile fibres of Cuba are contributed by RAMON DE LA SAGRA (pp. 1338, 1339), including the Daguilla or fibrous inner bark of the *Lagetta lutea*, together with cord made of it; cord and mats made of palm fibres; Magagna, the fibre of the *Paritium elatum*, and the fibre of the *Hibiscus cannabinus*. These were deemed worthy of Honourable Mention.

Samples of a valuable grass, the *Macrochloa tenacissima*, much used for the manufacture of cord, &c., and which might probably be advantageously employed by paper-makers, are exhibited by D. VILLARS, of Huesca (158, p. 1339). This was deemed worthy of Honourable Mention.

Plantain fibre, prepared from the stem of the plantain, *Musa sapientum*, is exhibited by A. VINAS, of Puerto Rico (160, p. 1339); and Pita, the fibre of the wild aloe, *Agave Americana*, is shown by P. DE LAS HERAS, of Murcia (161, p. 1339).

#### SECTION VI.—CELLULAR SUBSTANCES.

Comparatively few substances demanding the attention of the Jury are exhibited in this division: they may, in fact, be included under three heads,—namely, cork, rice paper, and amadon or German tinder.

The number of specimens of cork exhibited is very small: the most important series is a small collection shown by T. PATT (182, p. 205\*) in illustration of its uses and the mode in which it is manufactured. This was deemed worthy of Honourable Mention. Samples are likewise shown by H. FRENCH (127, p. 205\*).

Specimens of cork-wood (a very light wood, in certain respects resembling cork, and which might possibly be employed as a substitute for cork in some of its applications) are contributed from British Guiana by G. PONTIEX (102B, p. 984) and T. B. DUGGIN (102, p. 984). Several similar light and porous woods, such as the polae of the Archipelago, used for making floats for fishing-nets, are shown in the East Indian collection.

Good samples of French cork, both in the rough state and when cut by De Bommop's patent machinery, are exhibited by DUPRAT & Co. (492, p. 1201). Some fine specimens of Algerine cork are likewise shown in the French Department in the collection exhibited by the COMMISSION OF WOODS AND FORESTS (47, Alger., p. 1262). These were deemed worthy of Honourable Mention.

One specimen of good Portuguese cork is contributed by D—.

Very good samples of cork are shown in the Spanish collection by J. GUARANT, of Seville (188, p. 1341), and by the PROVINCE OF SEVILLA. These were each deemed worthy of Honourable Mention.

Samples of "shola," the cellular pith-like stems of the *Echynomene aspera* (*Hedyarum lagenarium*) from the vicinity of Calcutta, are shown in the East Indian collection. This remarkable substance, which closely resembles in appearance the well-known "rice paper," well

\* Awarded a Prize Medal by Jury of Class XXVIII.

merits attention, and promises to be available for several purposes in the arts. The specimens of shola are accompanied by various illustrations of the uses to which it is applied in India, including life-buoys, boxes, bottle-cases, and hats. From its loosely-cellular structure it is a very bad conductor of heat, and this, together with its great lightness, admirably fits it for the manufacture of hats. Shola is also used advantageously for purposes of ornament, and very beautiful models of temples and other eastern buildings are exhibited, which possess all the appearance of ivory, but with even more softness and delicacy of surface. These specimens were deemed worthy of Honourable Mention.

Rice paper, made from the pith of *Aralia papyrifera*, from China, is likewise shown.

Two good series of specimens of prepared amadou, or German tinder, the leathery base of a fungus (*Boletus ignarius*), are exhibited, namely, in the Austrian collection, by BACHRICH (45A, p. 1009), and in the Zollverein Department by F. A. BECKER SAPP & Co., of Friedeburg (471, p. 1078). These were each deemed worthy of Honourable Mention.

#### SECTION VII.—TIMBER AND ORNAMENTAL WOODS.

The collection of timber and other woods, taken as a whole, is remarkably complete and interesting; and though in many instances it is obviously impossible for the Jury to enter into the consideration of individual woods, or to do more than enumerate the varieties of the specimens shown, and even difficult in all cases to do that,—yet they considered it desirable to prepare as complete a list as possible of the various single collections included in the Exhibition, so as to form, as far as was practicable, a catalogue of the chief woods of different countries. The Jury would especially draw attention to the very interesting and valuable collections of East Indian woods (p. 885); the complete and well-arranged collection of W. W. SAUNDERS (Class IV., p. 196\*); the series of fine specimens shown by Messrs. FAUNTLEGER; the very instructive and excellent specimens exhibited by Messrs. LAWSON (135, pp. 205\*, 206\*), and by the FRENCH MINISTER OF WAR (p. 1262) in the Algerian collection of raw produce. Highly valuable, also, are the series of Canadian, Australian, and other colonial woods; and the numerous collection of the woods of Cuba, &c. &c.

The total annual importation of timber into Great Britain is nearly two million loads, or one hundred

million of cubic feet, entered under the several designations of timber or unsawn wood, deals and planks or sawn wood, teak, staves, and lathwood.

The following Table shows the countries from which wood was chiefly imported in the year 1849:—

|                         | Timber. | Deals.  | Teak.  | Staves. | Lath-wood. |
|-------------------------|---------|---------|--------|---------|------------|
| Russia —                | 41,419  | 173,586 | —      | 325     | 15,539     |
| Sweden —                | 28,679  | 79,843  | —      | 150     | 1,119      |
| Norway —                | 28,930  | 50,805  | —      | 95      | 103        |
| Prussia —               | 117,470 | 35,006  | —      | 19,213  | 6,169      |
| Hanse Towns —           | 2,441   | 68      | —      | 1,012   | —          |
| Tuscany —               | 2,299   | 9       | —      | —       | —          |
| Papal Territories —     | 2,106   | 3       | —      | —       | —          |

| British India —         | 1       | 2       | 17,459 | 56      | —          |
| Australia —             | 977     | 540     | 1      | 4       | —          |
| British North America — | 578,748 | 468,572 | 9      | 45,614  | 14,813     |
| British Guiana —        | 4       | 19      | 4      | 103     | —          |
| United States —         | 13,832  | 839     | —      | 13,309  | —          |
| Miscellaneous —         | 1,002   | 491     | 633    | 26      | 57         |
| Total Loads —           | 817,909 | 809,783 | 27,702 | 70,917  | 37,800     |

Of the chief woods employed in ship-building, seven have been acknowledged as first-rate by the authorities at Lloyd's; and to this number must now be added an eighth, namely, iron-bark, which has, in fact, only been admitted as a first-class wood since the period of opening the Exhibition in May, 1851. These eight woods are—

1. English oak.
2. American live-oak.
3. African oak.
4. Morung saul.
5. East Indian teak.
6. Green-heart.
7. Morra.
8. Iron-bark.

The collection of woods from all parts of the world, exhibited by W. W. SAUNDERS (9), is particularly valuable from its extent and arrangement, the woods being all well labelled and classified according to their geographical distribution. The value of this collection is greatly enhanced by the density and weight per cubic foot of each wood being given. The Jury awarded a Prize Medal for this series, the value of which is considerably increased by the following classified catalogue:—

#### WOODS, NATIVE OF OR GROWN IN BRITAIN.

| NAME.                                   | Place of Growth.      | Weight<br>lbs. oz. | Specific<br>Gravity. | No.<br>in Cata-<br>logue. | REMARKS.  |
|---|-----------------------|--------------------|----------------------|---------------------------|---|
| Able. See Populus.                      |                       |                    |                      |                           |   |
| Able excelsa (spruce fir)               | Oxfordshire           | 27 2               | .434                 | 31                        | Used for scaffold poles, ladders, common carpentry, &c.                                 |
| Acacia. See Robinia.                    |                       |                    |                      |                           |   |
| Acacia (?)                              | Mortlake              | 47 6               | .758                 | 75                        | "   |
| Acer campestre (maple)                  | Oxfordshire           | 37 1               | .593                 | 84                        | Used for ornamental work when knotted; it makes the best charcoal; and turns well.      |
|   | Epping                | 37 13              | .605                 | 562                       | Specimen from the lower part of the main stem of a young tree.                          |
| Acer pseudo-platanus (sycamore).        | Wandsworth            | 34 11              | .555                 | 598                       | Used in dry carpentry; turns well; and takes a fine polish.                             |
| Esculus hippocastanum (horse chestnut). | "                     | 24 2               | .386                 | 895                       | Used for inlaying toys, turnery, and dry carpentry.                                     |
| " " "                                   | Epping                | 29 15              | .479                 | 540                       | From the stem of a young and vigorous tree.   |
| " " "                                   | Oxfordshire           | 24 15              | .439                 | 25                        | "   |
| Alder. See Alnus.                       |                       |                    |                      |                           |   |
| Alnus glutinosa (alder)                 | "                     | 23 8               | .376                 | 45                        | Used for common turnery work, &c.; and lasts long under water, or buried in the ground. |
| " " "                                   | Epping                | 26 2               | .418                 | 543                       | Specimen taken near the ground.   |
| Apple. See Pyrus.                       |                       |                    |                      |                           |   |
| Arbutus unedo (Arbutus)                 | "                     | 44 12              | .716                 | 50                        | Hard, close-grained, and occasionally used by turners.                                  |
| " " "                                   | Lakes of Killybegney. | 45 6               | .726                 | 373                       | "   |
| " " "                                   | "                     | "                  | "                    | "                         | "   |

## WOODS, NATIVE OF OR GROWN IN BRITAIN—continued.

| NAME.                                 | Place of Growth. | Weight<br>per<br>Cubic Ft. | Specific<br>Gravity. | No.<br>in Cata-<br>logue. | REMARKS.  |
|---------------------------------------|------------------|----------------------------|----------------------|---------------------------|---|
| Aspen. <i>See</i> Populus.            |                  |                            |                      |                           |   |
| Barberry. <i>See</i> Berberis.        |                  |                            |                      |                           |   |
| Beech, common. <i>See</i> Fagus.      |                  |                            |                      |                           |   |
| Berberis vulgaris (Barberry)          | - - -            | 87 11                      | ·603                 | 83                        | Used chiefly for dyeing.  |
| Betula alba (common birch)            | Epping - -       | 34 14                      | ·554                 | 557                       | Inferior in quality, but much used in the north of England and Scotland for staves for herring-barrels.       |
| Bignonia radicans - - -               | Mortlake - -     | 19 3                       | 307                  | 650                       |   |
| Birch, common. <i>See</i> Betula.     |                  |                            |                      |                           |   |
| Blackthorn. <i>See</i> Prunus.        |                  |                            |                      |                           |   |
| Carpinus Betulus (hornbeam)           | Epping - -       | 40 5                       | ·645                 | 560                       | Very tough, and makes excellent cogs for wheels; forms a good charcoal; and is much valued for fuel.          |
| Castanea vesca (sweet chestnut)       | - - -            | 38 0                       | ·608                 | 798                       |   |
|                                       | Epping - -       | 37 6                       | ·438                 | 558                       | Specimen from the main stem, near the ground.   |
| ,, ,, (chestnut) - - -                | Cornwall - -     | 36 7                       | ·593                 | 796                       | Used in ship-building, and is much in repute for posts and rails, hop poles, &c.                              |
| Catalpa syriacifolia - - -            | Mortlake - -     | 26 4                       | ·420                 | 295                       | Said to be very durable, and capable of a fine polish.  |
| Cedar of Lebanon. <i>See</i> Cedrus.  |                  |                            |                      |                           |   |
| Cedrus Libani (Cedar of Lebanon).     | - - -            | 38 13                      | ·621                 | 660                       | Used for furniture, and sometimes for ornamental joinery work.  |
| ,, (?) ,, (cedar?) - - -              | Kew Gardens -    | 34 3                       | ·547                 | 76                        |   |
|                                       | - - -            | 36 12                      | ·548                 | 44                        |   |
| Cerasus vulgaris (May Duke cherry).   | Wandsworth -     | 41 1                       | ·657                 | 47                        | Cherry-wood is much used for common furniture.  |
| ,, ,, (common cherry)                 | - - -            | 33 3                       | ·539                 | 86                        | Excellent for common furniture, and much in repute; works easily, and takes a fine polish.                    |
|                                       | Epping - -       | 12 1                       | ·673                 | 555                       |   |
| Cherry. <i>See</i> Cerasus.           |                  |                            |                      |                           |   |
| Chestnut, horse. <i>See</i> Castanea. |                  |                            |                      |                           |   |
| ,, sweet. <i>See</i> Castanea.        |                  |                            |                      |                           |   |
| Cork-tree. <i>See</i> Quercus.        |                  |                            |                      |                           |   |
| Corylus Avellana (common nut)         | - - -            | 30 0                       | ·556                 | 85                        | The young wood is used for fishing-rods, walking-sticks, &c., &c.   |
| ,, ,, (hazel) - - -                   | Epping - -       | 36 8                       | ·584                 | 532                       |   |
| ,, ,, (filbert) - - -                 | Oxfordshire -    | 35 13                      | ·573                 | 94                        |   |
| ,, ,, - - -                           | Epping - -       | 37 4                       | ·596                 | 534                       |   |
| Crab. <i>See</i> Pyrus.               |                  |                            |                      |                           |   |
| Crataegus oxyacantha (white-thorn).   | Epping - -       | 45 14                      | ·731                 | 336                       | Hard, firm, and susceptible of a fine polish.   |
| Cupressus sempervirens - - -          | Mortlake - -     | 31 10                      | ·554                 | 657                       | Fine-grained and fragrant; very durable.  |

| „ „ „   | Epping — —       | 39 8                       | ·632                | 536                       | —   |
| <i>Pyrus communis</i> (Bergamot<br>pear).       | Bermondsey — —   | 38 9                       | ·617                | 19                        | Strong, compact, and close-grained; used<br>for turning handles to tools, &c., and<br>takes a good black dye. |
| „ „ „ (pear) — —                                | Oxfordshire — —  | 38 10                      | ·618                | 90                        | —   |
| „ „ „ (garden pear) — —                         | Epping — —       | 40 1                       | ·641                | 549                       | Specimen from the upper part of the main<br>stem.   |
| „ „ „ (swan's egg pear) — —                     | Wandsworth — —   | 34 9                       | ·553                | 604                       | —   |
| „ „ „ (wild pear) — —                           | Epping — —       | 39 4                       | ·628                | 544                       | Specimen from a young tree cut near the<br>ground.  |
| „ „ „   | — —              | 38 2                       | ·610                | 551                       | Specimen from the upper part of the main<br>stem.   |
| <i>Pyrus malus</i> (apple) — — —                | Oxfordshire — —  | 36 0                       | ·576                | 77                        | —   |
| „ „ „ (garden apple) — —                        | Epping — —       | 39 7                       | ·631                | 548                       | Specimen from the upper part of the stem.   |
| „ „ „ (crab) — — —                              | Oxfordshire — —  | 45 5                       | ·725                | 82                        | Specimen from a tree about twenty years old.  |
| „ „ „   | Yorkshire — —    | 45 6                       | ·726                | 297                       | Hard, close-grained, and strong.  |
| <i>Pyrus sorbus</i> (service tree) — —          | Epping — —       | 46 11                      | ·747                | 554                       | Hard, fine-grained, and compact; much re-<br>puted by millwrights for cog, friction<br>rollers, &c.           |

## WOODS, NATIVE OF OR GROWN IN BRITAIN—continued

| NAME  | Place of Growth.         | Weight<br>per<br>Cubic Ft. | Specific<br>Gravity | No<br>in<br>Cata-<br>logue | REMARKS.   |
|---|--------------------------|----------------------------|---------------------|----------------------------|--|
| <i>Pyrus terminalis</i> - - -                       | Isle of Wight -          | 42 7                       | ·679                | 372                        | Strong and fine-grained, used for turners  |
| <i>Quercus ilex</i> (evergreen oak) -               | Wandsworth -             | 47 5                       | ·757                | 599                        | Wood very shaly when aged, is durable and strong, and makes an excellent charcoal  |
| " " " "   | " -                      | 47 4                       | 756                 | 88                         | "  |
| <i>Quercus pedunculata</i> (English oak).           | Surrey -                 | 40 2                       | 642                 | 656                        | "  |
| " " "   | Sussex -                 | 39 0                       | 624                 | 104                        | This oak is much esteemed for ship-building, the strongest and most durable of British woods   |
| " " (pollard oak)                                   | Wandsworth -             | 44 10                      | 714                 | 304                        | From an old pollard tree   |
| " " (common oak)                                    | Epping -                 | 40 14                      | 654                 | 512                        | Part of a large lower branch   |
| " " "   | " -                      | 40 11                      | 651                 | 553                        | Part of a large branch   |
| <i>Quercus sessiliflora</i> (Welsh oak)             | - -                      | 37 11                      | 603                 | 262                        | A good wood for ship-building, said to be inferior to the common oak   |
| <i>Quercus suber</i> (cork tree) - -                | Botanic Garden, (in sea) | 59 10                      | 826                 | 503                        | Heavy and durable, but very apt to split   |
| <i>Quercus</i> sp. (American oak) -                 | Wandsworth -             | 42 9                       | 681                 | 608                        | Hard and compact   |
| " (bastard oak) -                                   | Fackley, Oxon -          | 33 6                       | 534                 | 30                         | "  |
| " (Spanish oak) -                                   | Oxfordshire -            | 43 13                      | 701                 | 29                         | Close grained, and apparently a good wood  |
| <i>Rhamnus alaternus</i> - - -                      | Mortlake -               | 48 6                       | 774                 | 632                        | Hard and close grained   |
| <i>Rhamnus catharticus</i> - - -                    | Epping Forest -          | 34 11                      | 555                 | 533                        | "  |
| <i>Rhamnus frangula</i> - - -                       | Epping -                 | 25 8                       | 408                 | 541                        | "  |
| <i>Robinia pseudo-acacia</i> (common acacia locust) | " -                      | 14 1                       | 705                 | 550                        | Specimen from the upper part of the main stem much used for treenails in ship-building, and in the United States as much in repute for posts and rails |
| " " "   | Wandsworth -             | 40 11                      | 651                 | 600                        | "  |
| " " "   | Mortlake -               | 35 6                       | 884                 | 703                        | "  |
| <i>Salix alba</i> (white willow) - -                | Worcester -              | 24 14                      | 115                 | 658                        | Used for toys, and by the millwright, is tough, elastic, and durable   |
| <i>Salix caprea</i> (palm willow) -                 | Oxfordshire -            | 24 8                       | 332                 | 799                        | Tough and elastic is much used for handles to tools, and makes good hurdles  |
| <i>Salix fragilis</i> (crack willow) -              | " -                      | 32 0                       | 392                 | 28                         | Light, pliant, and tough, is said to be very durable   |
| <i>Salix</i> — (black willow) -                     | " -                      | 3 6                        | 512                 | 79                         | Tough and elastic, well adapted for turning  |
| " " "   | " -                      | "                          | 536                 | 80                         | "  |
| " " "   | " -                      | "                          | 574                 | 806                        | "  |
| Willow See <i>Salix</i>                             |                          |                            |                     |                            |  |
| <i>Sambucus nigra</i> (common elder)                | " -                      | 14 0                       | 311                 | 27                         | "  |
| " " "   | Epping -                 | 37 11                      | 605                 | 561                        | "  |
| Scotch fir See <i>Pinus</i>                         |                          |                            |                     |                            |  |
| Service tree See <i>Pyrus</i>                       |                          |                            |                     |                            |  |
| Silver fir See <i>Pinus</i>                         |                          |                            |                     |                            |  |
| Spruce fir See <i>Abies</i>                         |                          |                            |                     |                            |  |
| Sycamore See <i>Acer</i>                            |                          |                            |                     |                            |  |
| <i>Syringa vulgaris</i> (lilac) - -                 | Wandsworth -             | 48 15                      | 783                 | 606                        | Very hard and compact  |

Wood of good quality; hard, and compact.

A very beautiful series of about 160 samples of the most useful and ornamental woods from various parts of the world is shown by Messrs. R. and J. HARRISON (6, pp. 195\*, 196\*). The woods are all cut in the form of books, and admirably exhibit the grain and other peculiarities of each specimen. For this collection also, the Jury awarded a Prize Medal.

A collection of ornamental foreign woods, and other materials employed in cabinet-work, is shown by Messrs. R. FAUNTLEROY and SONS (135, pp. 205\*, 206\*). The number of woods about fifty, the specimens being all cut and polished, so as to show the grain and colour of the wood to the greatest advantage. Of most of the woods, two or three specimens are shown side by side, one in the rough, or with the bark on, one in sections and a third cut longitudinally and polished. For this series the Jury awarded a Prize Medal.

A valuable and instructive series of all the principal woods used for turning is shown by Messrs. HOLTZAPFEL (14, p. 196\*), the character of each wood illustrated by the end of the specimen being turned, so as to show how it works under the tool in the lathe. For this collection the Jury awarded a Prize Medal.

Some remarkably fine specimens of veneering, in walnut and rosewood, are exhibited by Messrs. E. SCOTT and CO. (19). To these the Jury awarded a Prize Medal.

A valuable and extensive collection of 63 of the timber and ornamental woods of England is contributed by S. CROSS (136, pp. 206\*, 207\*, 208\*). This was deemed worthy of Honourable Mention.

The series of Scotch woods shown in Messrs. LAWSON'S collection (Class III., p. 206) is interesting on account of the beauty of the specimens, the excellent manner in which they are arranged and shown, and the instructive mode in which the characters and peculiar properties of each tree are made evident. The aculeous of grafts and diseases of trees are peculiarly good. Praise is also due to this, as to all the other divisions of Messrs. Lawson's collection, for the excellent catalogue which accompanies it, and which is full of useful information. The following is the list of the timber, ornamental, and fruit-trees:—

|                               |                      |
|-------------------------------|----------------------|
| <i>Acer campestre</i>         | Field maple.         |
| " <i>platanoides</i>          | Norway maple.        |
| " <i>pseudo-platanus</i>      | Sycamore.            |
| " <i>saccharinum</i>          | Sugar maple.         |
| " <i>striatum</i>             | Striped maple.       |
| <i>Aesculus hippocastanum</i> | Horse chestnut.      |
| <i>Alnus glutinosa</i>        | Alder.               |
| " <i>incana</i>               | Hoary-leaved alder.  |
| <i>Amygdalus communis</i>     | Almond.              |
| <i>Arbutus unedo</i>          | Arbutus.             |
| <i>Caragana arborescens</i>   | Siberian pea tree.   |
| <i>Carpinus betulus</i>       | Hornbeam.            |
| <i>Castanea vesca</i>         | Sweet chestnut.      |
| <i>Cerasus lusitanica</i>     | Portugal laurel.     |
| " <i>padus</i>                | Bird cherry.         |
| " <i>sylvestris</i>           | Wild cherry.         |
| " <i>vulgaris</i>             | Cherry.              |
| <i>Crataegus coccinea</i>     | Scarlet thorn.       |
| " <i>oxyacantha</i>           | Hawthorn.            |
| " <i>punctata</i>             | Dotted thorn.        |
| <i>Cupressus sempervirens</i> | Italian cypress.     |
| " <i>thyoides</i>             | White cedar.         |
| <i>Cydonia vulgaris</i>       | Quince.              |
| <i>Cytisus alpinus</i>        | Alpine laburnum.     |
| " <i>laburnum</i>             | Laburnum.            |
| " <i>scoparius</i>            | Broom.               |
| <i>Fagus sylvatica</i>        | Beech.               |
| <i>Fraxinus excelsior</i>     | Ash.                 |
| <i>Ilex aquifolium</i>        | Holly.               |
| <i>Juglans regia</i>          | Walnut.              |
| <i>Juniperus virginiana</i>   | Red cedar.           |
| <i>Mespilus germanica</i>     | Medlar.              |
| <i>Ornus europaea</i>         | Flowering ash.       |
| <i>Pinus Canadensis</i>       | Hemlock spruce.      |
| " <i>abies</i>                | Silver fir.          |
| " <i>balsamea</i>             | American silver fir. |
| " <i>alba</i>                 | White spruce.        |
| " <i>nigra</i>                | Black spruce.        |
| " <i>picea</i>                | Norway spruce.       |
| " <i>larix</i>                | Larch.               |
| " <i>milvæcarpa</i>           | American larch.      |

|                              |                      |
|------------------------------|----------------------|
| <i>Pinus pendula</i>         | Weeping larch.       |
| " <i>cedrus</i>              | Cedar of Lebanon.    |
| " <i>sylvestris</i>          | Scotch fir.          |
| " <i>laricio</i>             | Coriarian pine.      |
| " <i>laricio austriaca</i>   | Black Austrian pine. |
| " <i>pinaster</i>            | Pinaster.            |
| " <i>strobus</i>             | Weymouth pine.       |
| " <i>cembra</i>              | Swiss stone pine.    |
| <i>Populus alba</i>          | White poplar.        |
| " <i>nigra</i>               | Black poplar.        |
| <i>Prunus domestica</i>      | Plum.                |
| " <i>spinosa</i>             | Sloe.                |
| <i>Pyrus aucuparia</i>       | Mountain ash.        |
| " <i>communis</i>            | Pear.                |
| " <i>malus</i>               | Apple.               |
| <i>Quercus cerris</i>        | Turkey oak.          |
| " <i>coccinea</i>            | Scarlet oak.         |
| " <i>ilix</i>                | Evergreen oak.       |
| " <i>pedunculata</i>         | Common oak.          |
| " <i>sessiliflora</i>        | Ditto.               |
| <i>Robinia pseudo-acacia</i> | Locust tree.         |
| <i>Rhododendron arboreum</i> | Rhododendron.        |
| " <i>ponticum</i>            | Pontic ditto.        |
| <i>Salix alba</i>            | White willow.        |
| " <i>Babylonica</i>          | Weeping willow.      |
| " <i>caprea</i>              | Goats' willow.       |
| " <i>Forbyana</i>            | Forby's willow.      |
| " <i>fragilis</i>            | Crack willow.        |
| " <i>Russelliana</i>         | Bedford willow.      |
| " <i>triandra</i>            | Basket willow.       |
| " <i>viminialis</i>          | Osier.               |
| <i>Sambucus nigra</i>        | Elder.               |
| <i>Taxus baccata</i>         | Yew.                 |
| <i>Thuja occidentalis</i>    | Arbor vitae.         |
| <i>Ulmus campestris</i>      | Elm.                 |
| " <i>montana</i>             | Wych elm.            |
| <i>Viburnum opulus</i>       | Guelder rose.        |

The collection of foreign woods included in the Liverpool series of imports is also highly deserving of notice: many of the specimens are unusually fine, and they are all well shown and arranged. (See p. 69.)

Besides these more important collections, various single specimens deserving Honourable Mention are exhibited. Among these are some samples of woods grown in Perthshire and Argyleshire by the Marquis of BREADALBANE (134, p. 205\*); a sample of Scotch fir grown in Strathavon, from Sir W. MURRAY, Bart. (137, p. 208\*); a series of Irish woods exhibited by J. LONG (47, p. 198\*); a small collection of Irish woods contributed by J. CLARSON (22, p. 196\*). These were severally deemed worthy of Honourable Mention.

Beautiful specimens are exhibited of St. Domingo mahogany, from Messrs. GILLOW and Co. (15, p. 196\*), and some remarkably handsome oak veneers from an oak grown in Whitlebury Forest, Northamptonshire, are also exhibited by Messrs. GILLOW (Class XXVI. 186, p. 748). These were severally deemed worthy of Honourable Mention.

A picture-frame exhibited by D. SAMUELS (21A, p. 196\*), formed of various common English woods, chiefly oak, elm, and ash, was deemed worthy of Honourable Mention.

Some good specimens of English woods are likewise exhibited by R. C. FITCH (8, p. 196\*).

Several specimens of bog wood of different kinds, and from various localities, are shown. Among these are slabs of bog oak, yew, and fir, from Lord DILLON (138, p. 208\*); and bog fir from the Marquis of BREADALBANE (134, p. 205\*). These were severally deemed worthy of Honourable Mention.

In connexion with the various collections of wood, attention must be paid to the different processes for seasoning and preserving it from the influence of the weather, dry rot, and the attacks of insects, boring-worms, &c. These and other causes form very serious obstacles to the use of wood for many purposes; and accordingly a number of plans have from time to time been proposed, having for their object the cheap and effectual preservation of wood. Among these schemes, five in particular have attracted especial attention; namely, the plans of Messrs. KYAN, BOURGAIN, FURNETT, BETHELL, and PAVIA. Of these, the first and last

are not represented in the Exhibition, and therefore do not come before the Jury, though the machinery employed by Mr. Payne is exhibited, but without any specimen of impregnated or preserved wood.

Sir W. BURNETT exhibits an interesting series of specimens in illustration of his mode of preserving wood, &c., and in proof of its efficacy (7, p. 196\*). This process, which consists in impregnating it with a solution of chloride of zinc, was patented in 1836, four years after the date of Kyan's patent, in which a solution of corrosive sublimate was employed for the same purpose. The specimens shown are highly satisfactory, and clearly prove the high preserving power of the solution of zinc. The Jury awarded a Prize Medal for this process.

The specimens shown by Mr. J. H. TULL (21, p. 196\*) are likewise highly interesting and satisfactory. The process employed in this case, and for which a patent was obtained in 1838, consists in thoroughly impregnating the wood with oil of tar containing creosote, and a crude solution of acetate of iron, commonly called pyrolignite of iron. The idea of preserving wood by the action of oil of tar, or similar liquids, is by no means new. In 1766, Hales recommended that the planks of ships should be soaked in vegetable oil to prevent the injury to which wood is subject when alternately exposed to wet and dry; and, indeed, many ships were built in which a hollow place was cut in one end of each beam or stern-post, so that it might be constantly kept filled with train oil. Among other ships so constructed, the "Fame," 71, may be mentioned. When, after some years, this ship was repaired, it was found that, as far as the oil had penetrated—namely, from 12 to 18 inches from the end—the wood was quite sound, whilst the other parts were more or less decayed. In 1805, Mr. Macconochie proposed to saturate with resins and oily matters inferior woods, and thus render them more lasting. This proposal was practically carried out in 1811 by Mr. Lukin, who constructed a peculiar oven for the purpose of thus impregnating wood under the influence of an increased temperature. The scheme, however, had but very partial success, for either the heat was too low and the wood was not thoroughly aired and seasoned, or it was too high and the wood was more or less scorched and burnt. The importance of oil as a preserving agent for wood is also shown by the fact that whalers, and other ships employed in the oil trade, the timbers of which become thoroughly saturated with oil or grease, invariably last longer—and are less subject to decay of any sort—than other vessels. It is also well known that the staves of old tallow-casks make a more lasting and durable fence than any other sort of wood, an effect entirely due to the protecting influence of the oil with which they have become saturated.

The operation, as conducted by Mr. Bethell, is carried on in a strong cylindrical vessel connected with a powerful air-pump, so that in the first instance a vacuum being formed, and subsequently a pressure of several atmospheres applied, the liquid may as much as possible be forced into all the pores of the wood. It is stated that wood thus prepared is not only protected from decay, and from the attacks of insects, but also that it becomes stronger and tougher in consequence of the layer of bituminous matter with which the woody fibre becomes encrusted. Among the specimens exhibited are portions of railway sleepers which have been in use for several years, and which are perfectly sound, whilst others from the same situation, but not prepared, are quite destroyed. Portions of piles which have been four years in the sea in Lowestoft harbour, and which are quite sound, are also shown. This process has been extensively employed in the preparation of railway sleepers for more than ten years, and the result of its application appears in every case to be highly satisfactory where the process has been well conducted. The Jury therefore awarded a Prize Medal to Mr. Bethell. (See p. 153\*)

Mr. Foulton, of wood, though it will not altogether decay, nevertheless considerably increases its durability, and is of the very utmost importance. The value of any process for preserving wood, of course, to some extent, on the

time required for its completion. A valuable series of specimens is shown by Mr. C. H. NEWTON (20, p. 196\*) in illustration of Davison and Symington's patent process for speedily and effectually seasoning wood by exposing it to the influence of a rapid and continuous current of heated air, so that it soon becomes thoroughly dry. The practical value of this process appears to be satisfactorily proved, and the Jury accordingly deemed it worthy of Honourable Mention.

A fine specimen of elm, cut across the grain, and well seasoned by steeping in water and very slow drying, is shown by Sir W. MURRAY, Bart. (187, p. 208\*).

A sample of Welsh oak, stated to be seasoned by a new process, which renders it better suited to the purposes of the cabinet-maker, is exhibited by W. EVANS (9A, p. 196\*).

The collection of East Indian woods, exhibited by the HONOURABLE EAST INDIA COMPANY (p. 884) is by far the most extensive series of woods in the whole Exhibition, and constitutes a very valuable part of the great collection of Indian raw produce. It is remarkable for the large number of specimens, the excellence of many of them, and the valuable practical information to be gained by their examination. The collection consists of many hundred specimens, and includes several minor or local collections of great interest. Amongst these are the valuable collections of Drs. ROXBURGH and WALLICH (884, 885); and extensive series of the woods of the Malay peninsula, Amherst, Tavoy, Tenasserim, Prince of Wales Island, Assam, Cuddapah, Madras, Orissa, &c.

Considering the extent and importance of Dr. Wallich's collection, the Jury would certainly have awarded to him a medal had not the fact of his being a member of the Jury precluded them from doing so. They awarded a Prize Medal to Mr. COMMISSIONER BLENDALL (p. 885), for a very valuable collection of Amherst woods. They also awarded a Prize Medal to Messrs. ALMUDA of Singapore (p. 890), for fine specimens of Lingoo-wood and Kayu-luka.

The smaller series of woods contributed by Messrs. A. P. ONSTOW, of Ganjam; D. MARIN, of Cuddapah (p. 188); WALLER ELLIOTT of Vizagapatam; J. E. CHAPMAN; Lieut.-Col. TILLOCH; The COMMISSARY-GENERAL of MADRAS; Captain OGILVIE, of Masulipatam; Captain MAIFLAND, and Major BALLOU, of Madras; Dr. HUNTER of Madras; Dr. WIGHT, of Coimbatore; Captain MARQUART, of Chittagong; and J. R. COLVIN, of Moulmein (pp. 888, 891), were also severally deemed worthy of Honourable Mention.

The nature and properties of many of these Indian woods is very little known; and though, for the most part, it is not probable that it would be found worth importing into Europe, yet their importance to India is every year increasing, and must necessarily continue to do so, as the demand for timber in India for railways and other engineering works increases. For such uses it is desirable, not only that the wood should be strong and not liable to decay from mere exposure to the weather, but, also, that it should work freely, and be able to withstand the ravages of the various insects to which wood of all kinds is more or less exposed in tropical countries. It is true that even the most porous and spongy woods may be rendered to some extent capable of resisting all such influences, by being impregnated with various solutions, as in the processes just adverted to; but it is obviously far better, when possible, to select such woods as are naturally saturated with resinous and aromatic substances, as in this latter case all cost of preparation is saved, besides that the preserving matter is far more perfectly disseminated throughout the whole of the wood than can possibly be effected by any artificial process after the tree is felled.

In examining the comparative value of different sorts of wood, it is of the first importance to ascertain the nature of the encrusting matter deposited throughout the cells and tubes of the wood. For all practical purposes, those woods appear to be best in which the cells are lined with resinous matter; those filled with hygroscopic matter are, for the most part, of less value; they are seasoned with difficulty, and are always more liable to

decay. The best woods are those having a strong fibre, protected from all external influences by a coat of resinous matter, or at least of a matter insoluble in water, and one which does not attract atmospheric moisture.

It is probable, also, that some of the ornamental and other woods of India will become articles of import when their properties and uses are better known and appreciated by our artisans.

Dr. Wallich's collection consists of about 450 specimens, and may be divided into the woods of Nepal, those of Tavoy, those of Gualpara, and those grown near Calcutta.

In the following general list of the woods contributed by the Indian Government, Dr. Wallich's collections are numbered 1, 2, 3, 13, and 23.

## No. 1.—WOODS OF NEPAL (DR. WALLICH)

| No. | Name.                        | Nepal.                                  | Portutta    | Remarks.                                  |
|-----|------------------------------|---|-------------|---|
| 1   | <i>Acacia mollis</i>         | -                                       | -           | A large tree; soft wood.                  |
| 2   | " <i>fragrans</i>            | -                                       | -           | -   |
| 3   | " "                          | Joolchumali                             | -           | Very large tree; useful wood.             |
| 4   | <i>Acer laevigatum</i>       | Sustendi                                | Cherouni    | Used in building.                         |
| 5   | " <i>sterculiaceum</i>       | -                                       | -           | Very large tree; soft wood.               |
| 6   | " <i>oblongum</i>            | -                                       | -           | Very large tree; good wood.               |
| 7   | <i>Adamia cyanea</i>         | Bansook                                 | Bansook     | A shrub                                   |
| 8   | <i>Alnus nepalensis</i>      | -                                       | -           | Pale brown; a hard wood.                  |
| 9   | <i>Andromeda ovalifolia</i>  | Jugroochat                              | Angaice     | A shrub; soft wood; used for fuel.        |
| 10  | " <i>formosa</i>             | Sheabaga                                | -           | Large tree; fine grain; hard wood.        |
| 11  | " <i>cordata</i>             | -                                       | -           | Brown wood.                               |
| 12  | " "                          | -                                       | -           | -   |
| 13  | " "                          | -                                       | -           | -   |
| 14  | <i>Aralia digitata</i>       | Leesong.                                | -           | -   |
| 15  | " <i>nodosa</i>              | -                                       | -           | A soft wood; used for boxes.              |
| 16  | " "                          | -                                       | -           | -   |
| 17  | <i>Bauhinia</i>              | -                                       | Korla.      | -   |
| 18  | " "                          | -                                       | -           | -   |
| 19  | <i>Berberis pinnatifolia</i> | Milkissee                               | Jumie-munda | A large tree                              |
| 20  | " <i>asiatica</i>            | Matekisse                               | Chitra      | A shrub; yellow wood.                     |
| 21  | <i>Betula leptostachya</i>   | -                                       | -           | A tree; good wood                         |
| 22  | " <i>cylindrostachya</i>     | -                                       | -           | " wood shaky.                             |

| 215 | <i>Vitis</i> - - -                   |                               |                | Spongy, coarse wood.                      |
| 216 | <i>Wightia gigantea</i> - - -        |                               |                | A large climber.                          |
| 217 | <i>Wistaria incurva</i> - - -        | Kadubusi                      | Harobee        | A good wood.                              |
| 218 | " - - -                              | Choorosi                      |                | Very fine wood.                           |
| 219 | " - - -                              | Jookshiba                     |                |   |
| 220 | " - - -                              | Khura                         |                | Useless wood.                             |
| 221 | " - - -                              | Kujulsee                      | Kujulsee       | Strong, good wood.                        |
| 222 | " - - -                              | Kurani                        | Birouni        |   |
| 223 | " - - -                              | Mucuna                        |                | A climber.                                |

The wood of several species of *Briodelia* forms excellent timber. The Assama, *Briodelia montana*, is common in Canara, where it attains great size, and, for building purposes, seems little—if at all—inferior to teak; it is said to resist the action of water quite as well.

## No. 2.—WOODS OF GUALPARA (DR. WALLICH).

|                                 |                |   |
|---------------------------------|----------------|---|
| <i>Acacia odoratissima</i>      | Jatikorai      | Hard wood; used for furniture.  |
| <i>marginata</i>                | Korni          | Yields good planks.   |
| <i>Alstonia scholaris</i>       | Chatiyan       | Used for common furniture.  |
| <i>antidyenterica</i>           | Dudkhuri       | A large tree.   |
| <i>Anacardium latifolium</i>    | Bheia          | Used for chests, couches, &c.   |
| <i>Andrachne trifoliata</i>     | Uffiam         | Used for common furniture.  |
| <i>Antidesma</i>                | Boro-helock    |   |
| <i>Aquilaria agalloch</i>       | Aggur          | Contains a volatile oil.  |
| <i>Artocarpus champ</i>         | Kangtali chama | An immense tree; used for canoes.                                       |
| <i>Bauhinia sutra</i>           | Tukra          | A close-grained, soft, tough, yellow wood.                              |
| <i>lacuria</i>                  | Bakuri         | An open-grained, soft, tough wood.                                      |
| <i>Bhiza moya</i>               | Moj            | A close-grained, hard wood.   |
| <i>Bigonia calais</i>           | Kolai-beng     | Used for fuel only.   |
| <i>Briodelia stipularis</i>     | Kohi           | Close, hard, tough wood.  |
| <i>Butea frondosa</i>           | Potash         | (Open, soft, tough wood; used for common furniture.                     |
| <i>Callicarpa arborea</i>       | Khoja          | Used for mortars, pestles, and common furniture.                        |
| <i>Calyptanthus</i>             | Jam            | Used for common planks.   |
| <i>Careya</i>                   | Saljam         | A close, tough, hard wood.  |
| <i>Cassia fistula</i>           | Kombo          | Close, hard, strong, tough wood.  |
| <i>Castanea</i>                 | Sonali         | "    "    used for ploughs.   |
|                                 | Golsingur      | Excellent hard, tough timber.   |
|                                 | Nikari         | Excellent timber; used for canoes and furniture.                        |
|                                 | Kangta Singgur | Somewhat inferior to preceding.   |
| <i>Cedrela Toona</i>            | Toon, or Tungd | Brown, aromatic wood, rather brittle; used for furniture.               |
| <i>Chrysophyllum acuminatum</i> | Pithogakh      | A white, tough wood; used for furniture.                                |
| <i>Croton oblongifolium</i>     | Parokupi       | A close-grained, rather brittle wood; used for common furniture.        |
|                                 | Lalputja       | Hard, close-grained wood; used for canoes.                              |
| <i>Dalbergia monnita</i>        |                | Close, hard, tough wood; used for common furniture.                     |
| <i>Decasidia spicata</i>        | Bongyera       |   |
| <i>Dillenia pilosa</i>          | Danc-oksi      | Open, but hard and tough; used for canoes.                              |
| <i>pentagyna</i>                | Oksi           | "    "    but closer wood.  |
| <i>speciosa</i>                 |                | Close and hard, but rather brittle.                                     |
| <i>Ekebergia</i>                | Jiyakohi       | Valuable wood, like mahogany.   |
| <i>Fagra rhesa</i>              | Bajarmondi     | Close, hard, tough, good wood.  |
| <i>Ficus undulata</i>           | Bakhapanj      | Open, soft, rather tough wood; used for canoes.                         |
| <i>Ficus oppositifolia</i>      | Khokadumor     | Soft, open, brittle wood.   |
| <i>Gordonia</i>                 | Borjam         | Useful for turning.   |
| <i>Gmelina arborea</i>          | Gambhari       | Right and durable wood; used for turning.                               |
| <i>Jambolifera pedunculata</i>  | Holkholi       | Used for gun-stocks.  |
| <i>Bagerstromia parviflora</i>  | Sida           | A large tree; close, tough, good wood.                                  |
| <i>reginae</i>                  | Jai ul         | "    "    excellent wood.   |
| <i>Laurus salicifolia</i>       | Horisongher    | Used for common furniture.  |
| <i>champa</i>                   | Kurka champa   |   |
| <i>Meliacea</i>                 | Tokor          | A large tree; used for planks, canoes, and common furniture.            |
| <i>Mimusops (?)</i>             | Chalpata       | Used for coarse furniture.  |
| <i>Myrtinda</i>                 | Silapoma       | "    "    "    "  |
| <i>Myristica</i>                | Jheraya        | "    "    "    "  |
| <i>Nauclea cadamba</i>          | Kodam          | A noble tree, yellow wood; used for common furniture.                   |
| <i>Nerium tomentosum</i>        | Adhkuri        | Used for furniture.   |
| <i>antidyentericum</i>          | Dudkhuri       | "    "    "    "    and for turning.                                    |
| <i>Phyllanthus (?)</i>          | Hoinhara       | Used for coarse furniture.  |
| <i>Premna hirtica</i>           | Chukagambhori  | A large tree; the wood has a very peculiar aromatic odour.              |
| <i>flavescens</i>               | Bukdholi       | Very inferior to the preceding.   |
| <i>Quercus</i>                  | Tima           | Used for coarse furniture.  |
| <i>Rhamnus</i>                  | Bangla         | Used for chests, stools, &c.  |
| <i>Rhamnus</i>                  | Prenna (?)     | Used for chests, canoes, &c.  |
| <i>Sapindace</i>                | Dophari        | Used for coarse furniture.  |
| <i>Schinus nara</i>             | Nyior          | A hard, close-grained, rather brittle wood; preferred for furniture.    |
| <i>Spondias amara</i>           | Arira          | Not used.   |
| <i>Sterculia</i>                | Bahelli        | Used for canoes.  |
| <i>urens</i>                    | Odla           | Ditto, rope made from the bark.   |
| <i>Stravadium acutangulum</i>   | Hendol         | Poor wood, but much used.   |
| <i>Terminalia bellerica</i>     | Bauri          | Used for canoes.  |
| <i>moluccana</i>                | Joril          | Light and durable timber; used in boat-building.                        |
| <i>hilka</i>                    | Hilkia         | Used for canoes and furniture.  |
| <i>Tetranthera caduca</i>       | Pangch-Petiya  | Used for common carpentry.  |
| <i>paromonia</i>                | Huo's          | Close, soft wood: used for coarse furniture.                            |
| <i>dorodmeda</i>                | Par mija       | "    "    "    "  |
| <i>Tornez japonica</i>          | Vagapl         | "    "    "    "  |
| <i>Trophis (?) aspera</i>       | Uluyachama     | Used for small canoes.  |
| <i>Uvaria suberosa</i>          | Saora          | Used for joiners' work.   |
|                                 | Bandookola     | A soft, close-grained, brittle wood; used for planks, posts, beams, &c. |
| <i>Xanguaria edulis</i>         | Moyen          | Used for coarse furniture; a small tree.                                |
| <i>Vernonia</i>                 | Magor          |   |
| <i>Vitex acuminata</i>          | Angghul        | A very close, hard, brittle wood; used for mortars, oil-mills, &c.      |
| <i>babula</i>                   | Babla          | A close, soft, tough wood; used for common furniture, &c.               |
| <i>leucocylon</i>               | Rhodya         | Used for making ploughs.  |
| <i>?</i>                        | Chotagotadhora |   |
| <i>?</i>                        | Chung          | A large tree; close, tough wood; used for furniture.                    |
| <i>?</i>                        | Kakajya        | Wood not used.  |
| <i>?</i>                        | Nikari         | Used for canoes and furniture.  |

"Chattyan" or "Sativan," *Alstonia scholaris*, grows to a large size in the forests of Canara, the wood is white and compact, and well adapted for turning purposes.

The "Jarrol" or "Jarri," *Lagerstræmia Rapahe.* This tree grows to a great size in the Chittagong district, though the forests are now, to a great extent, cleared of the best variety. It is considered an excellent wood for ship building; it is tough, has the character of standing well in water, and is much used for beams, rafters, and boards.

The "Gomar" or "Gambhari," *Gmelina arborea*, is abundant in the Morung and Chittagong forests. It is a weak wood, but is in great estimation for picture-frames, sounding-boards, organ-pipes, Venetian blinds, and all sorts of light work in which shrinkage is to be avoided. Its specific gravity is 0.466; its strength, according to Captain Baker, compared to teak, at 498 to 869.

"Toon," *Cedrela Toona*, is a somewhat coarse-grained wood, but very extensively used throughout India for furniture and interior carpenters' work.

| <i>Urtica pulcherrima</i> .     |   |   |          |                                 |

A very fine specimen of mahogany, grown in the Botanic Garden at Calcutta, is also exhibited, showing that excellent "Spanish mahogany" may be raised in the East Indies. This is a matter of some importance, for although there are many woods in India which rival the mahogany in beauty, there is hardly any known wood which combines all the valuable qualities of the latter, uniting at the same time a rich colour, a fine grain, and the character of working kindly and freely under the tool.

    wood.  
Mimusops hexandra.  
Putranjiva Roxburghii.  
Robinia macrophylla.  
Santalum album. (Santal  
    wood.

These specimens are from Dr. Carey's Botanic Garden near Calcutta. The blackwood or "rosewood" still (*Dalbergia latifolia*) grows to a very large size on the Malabar coast. It is a close-grained, greenish, black wood, beautifully marked with lighter-coloured veins. It is a heavy, close-grained wood, and is much used in the manufacture of furniture, as it takes a very high polish.

For engineering purposes, and especially for gun carriages, it is very valuable, and in consequence large forests of it have been formed in waste places in the North-West provinces of Hindustan.

"Sandal wood" (*Santalum album*) is well known and esteemed, on account of its peculiar perfume. It is used in cabinet-work, for fans, beads, ornaments, and all sorts of carved fancy-work. The bark of this tree contains a beautiful red colouring matter, which, however, does not appear to be practically made use of.

The "Saul" or "Sal," *Shorea robusta*, belonging to the family of *Dipterocarpea*, is perhaps the most valuable

and extensively used of all the timber trees of India. It is a heavy, close-grained, light-brown wood. From the bad and careless manner in which the trees are felled, and from the injudicious mode in which the timber is squared, its value is often considerably diminished. The Saul timber brought down to Calcutta is seldom more than 30 feet in length. Its specific gravity varies from 0.92 to 1.182, and in strength and tenacity it is considerably superior to the best teak. From Captain Baker's excellent experiments, it appears that, compared with teak, its strength is about as 1121 to 869. From Major H. Campbell's valuable experiments, unseasoned Saul broke with a weight of 1308 lbs., seasoned Saul with 1319 lbs., and teak wood with 1091 lbs. It is unquestionably the most useful known Indian timber for engineering purposes; as a building wood, unless very well seasoned, it is somewhat apt to shrink.

"Kadum berriya," *Diospyros ebenaster*, a variety of Coromandel or Calamander, a striped wood, having a light-brown colour; it is a handsome furniture wood, which turns well, and is admirably adapted for veneering, and all sorts of cabinet-work.

"Hnragulu," *Chloroxylon swietenia*, yields the beautiful wood used for veneering and other cabinet-work, commonly called Satin-wood: the tree never grows to a large size.

"Chinta kurra," *Tamarindus indica*, is a strong and handsome wood, used for furniture, for washermen's boards, and in the manufacture of oil and sugar mills.

"Pulan" or "Pallas," *Butea frondosa*. The wood of this beautiful and useful tree is hardly distinguishable from teak, the timber is large, but it is almost always knotted and gnarled.

#### No. 8. WOODS FROM MADRAS (The COMMISSIONER GENERAL and Captain MAITLAND.)

1. Atta; Anthem marum.
2. Anena; Pterocarpus sp.
3. Chittagong wood; Agray; Chickrassia tabularis.
4. Ervombalu wood; Hoombilly marum; Feriola buxifolia.
5. Mango wood; Am; Mang cuttal, Mangifera indica.
6. Nodnah.
7. Paris kajhar; Poorsum marum; Hibiscus populneus.
8. Peddawk wood.
9. Pala; Pala kurou; Paulai marum; Mimosa hexandra.
10. Rosewood; silsoo; Katty marum; Dalbergia.
11. Satin-wood; billa kurra; Chloroxylon Swietenia.
12. Saul; tapai; aussena; Shorea robusta.
13. Tectonaria; Jerrya Ammonilla.
14. Teak; jarkoo; joko marum, vyvan; Tectona grandis.
15. Woodia; oathay marum; Odina Wodier.

"Chittagong" wood, *Chickrassia tabularis*: the wood of this tree is white, tough, and close-grained; it is, however, but little used.

#### No. 9.—WOODS OF TRAVANCORE (Col. FRITH).

| NAME.                 | Colour.      | Specific Gravity. | REMARKS.   |
|-----------------------|--------------|-------------------|--|
| 1. Ahgullb            | Light yel    | 0.674             | Very abundant; used for furniture.                                 |
| 2. Attoo vunjee       | Amber colour | 0.480             | Very cheap; used for firewood.                                     |
| 3. Aranellah          | Dark brown   | 0.643             | For building common houses.  |
| 4. Chinny             | Rather dark  | 0.515             | From 8 to 16 feet in circumference; used for building carpes.      |
| 5. Cherrotimba        | Dark         | 0.843             | About 3 feet in circumference; used for house-building, tools, &c. |
| 6. Cherro tanny       | Light        | -                 | Firewood.  |
| 7. Carcomaradcoo      | Dark brown   | -                 | 2 to 6 feet in circumference; used for carts and building.         |
| 8. Chorobadamboo      | Yellow       | 0.520             | Used for packing-cases.  |

| 81. Yuttamba                    | "             | -                 | Used for building houses, and light work.  |

These woods, as well as the collections from Palam-cottah (No. 11), from Paulghaut (No. 12), from Tinevelly (No. 13), from Canara (No. 14), and from Penang (No. 30), were selected and sent over by the late Col. Frith; they are exhibited by Lieut.-Col. BONNER, military store-

keeper of the Hon. East India Company. The specific gravities have been calculated from comparatively imperfect data, and therefore can only be regarded as rough approximations.

## No. 10.—WOODS OF HINDOSTAN (Dr. Roxburgh).

| 34. | Vateria lancifolia      | 53                     | 15   |

Specimens of the wood of the Indian cedar, *Cedrus Deodara*, and of the cypress, *Cupressus torulosa*, from the Himalayas, are shown by Dr. ROYLE; the former—re-

cently introduced into this country as a beautiful ornamental tree,—appears to promise well as a useful timber tree; the wood works well and freely.

## No. 11.—WOODS OF PALAM-COTTAH (Col. FRITH).

| NAME.                   | Colour.     | Specific Gravity. | REMARKS.  |

"Nur cadumbai marum," *Nauclea parviflora*, is rather common in the forests of Canara, especially below the Ghats; it is valued as yielding excellent flooring planks. Only two specimens of wood are contributed from

Bombay, namely, teak, and a variety of olive, lately identified by Dr. Stuecke; the latter appears to be a good and valuable wood for some sorts of work.

## No. 15.—WOODS OF CANARA (Col. FAIRIE).

| 24. Marraveh     | Darkish      | 0.826             | A heavy wood; used for beams and posts.   |
| 25. Madthy       | Light brown  | -                 | Used for house and boat-building, and for furniture.                                      |
| 26.              | Dark         | -                 | 3 feet in circumference, 40 feet long; used for beams of houses.                          |
| 27. Sagwany      | Brown        | -                 | Third sort of teak.   |
| 28.              | "            | -                 | Finest sort of teak.  |
| 29. Teeravah     | Light        | -                 | Not strong; used for light work.  |

No. 16.—WOODS OF MALABAR FORESTS  
(J. E. CHAPMAN).

- |  |   |
|--|---|
| 1. Jamboe; a very heavy wood.          | 10. Ombah.  |
| 2. Kad kud.                            | 11. Pood goosaa.                                  |
| 3. Kelaho.                             | 12. Ruculi Kanurah; a very straight-grained wood. |
| 4. Koompoly.                           | 13. Sataurah; a light, soft, close wood.          |
| 5. Kendel; a heavy, strong, dark wood. | 14. Sarrah.                                       |
| 6. Kungane.                            | 15. Seerass.                                      |
| 7. Kuring.                             | 16. Sood becho.                                   |
| 8. Kumdeo.                             | 17. Sawree; a white, soft wood, very light.       |
| 9. Marice; a very heavy, brown wood.   | 18. Teh pully.                                    |

"Jamboe," or Janahu, *Mimosa xylocarpa*. This tree grows to a large size; on account of its strength and toughness, it is much valued for house-building.

"Mairtee," *Pentaptera coriacea*, a very common tree both above and below the Ghats. The wood is very durable, and is therefore used in house, ship, and boat-building.

These woods were collected, in 1846, by Dr Gibson, Conservator of Forests in the Bombay Presidency, for Mr. Chapman, in connexion with the projected "Great Indian Peninsula Railway." Previous to the appointment of Dr. Gibson, the forests in this presidency, particularly those south of Bombay and between the western Ghats and the Indian Ocean, were almost entirely left to the management of the natives in their immediate neighbourhood; the consequence of this was, that, as the country under British rule became more settled, and as the population in those districts increased, the forests were gradually destroyed, the timber being cut down in the most reckless and wasteful manner, and a considerable quantity of it burnt, for the mere purpose of affording ashes for manure. Regulations have now, however, been adopted, under the superintendence of Dr. Gibson, for the preservation and maintenance of forests, so that, for the future, such thoughtless and inconsiderate destruction of them will be prevented. At present, the Government and mercantile yards of Bombay are chiefly

supplied with timber from the Concan, to the north of the latitude of Bombay. In the Deccan, the supply of timber, of any size, is very limited; it has, therefore, for the most part, to be brought from a distance, and the expense and difficulties of transit present serious obstacles to its employment in buildings of all descriptions. Mr. Chapman states, that a short time since, when Vicenjee Merjee, Esq., an enterprising Parsee capitalist, built a house at Hyderabad, he was obliged to have all the principal beams carried up from Bombay, a distance of more than 500 miles; and at the present time, most of the timber of the country is greatly diminished in value, being of necessity cut down, and reduced to shapes and sizes most convenient for land-carriage. From Dr. Gibson's reports it appears that the forests of Soonda and Canara, if properly managed, will, in a few years, afford a large and regular supply of first-rate timber.

## No. 17.—WOODS OF ROHILKUND.

These are from the districts of Bareilly and Phillibheet—

- |                         |                          |
|-------------------------|--------------------------|
| 1. Acacia Arabica       | 12. Mulberry.            |
| 2. " catechu.           | 13. Melia Azadirachta;   |
| 3. Basia latifolia      | nona or nimh.            |
| 4. Bombax heptaphyllum. | 14. Acacia serissa.      |
| 5. Calyptanthura sp.    | 15. Nauclea pumila.      |
| 6. Cedrela sp.          | 16. " cordifolia.        |
| 7. Chowlaeo (?)         | 17. Phyllanthus Emblica. |
| 8. Dalbergia sissoo.    | 18. Rohunco (?)          |
| 9. Goshun (?)           | 19. Shorea robusta.      |
| 10. Grewia.             | 20. Urtica (?)           |
| 11. Khumar (?)          | 21. Wrightia mollissima. |

The "Sissoo wood," *Dalbergia Sissoo*, somewhat resembles the finer sorts of teak, but it is tougher, and more elastic. It usually grows to a height of about 30 feet, but is generally more or less crooked, and therefore not suited for beams, though highly valued by the ship-builders of Bengal. The wood is said to harden with age. When fresh, its specific gravity is 0.691; when seasoned, 0.764; and according to Captain Baker, compared with teak, its strength is as 1030 to 869. It has a light greyish-

brown colour, with darker coloured veins, and when examined with a lens, the pores of the wood are found to be nearly filled with dry resinous matter.

"Neem wood," *Melia Azadirachta*, a large tree, which is used for making carved images, as it is not liable to the attack of insects.

#### No. 18.—WOODS OF ASSAM.

"These woods, grown in the forests of the province of Assam, are contributed by Mr. MARTIN, Major HANNAY, and Captain RIND (p. 884):—

- |                                       |   |
|---------------------------------------|---|
| 1. Acacia.                            | 10. Nadosur (?)                               |
| 2. Agar.                              | 11. Naboo ( <i>Casuarina equisetifolia</i> ?) |
| 3. Babus.                             | 12. Oak, hingoroe.                            |
| 4. Cattul.                            | 13. Pome ( <i>Cedrela Toona</i> ).            |
| 5. Cham ( <i>Artocarpus chama</i> ).  | 14. Rasta.                                    |
| 6. Dalbergia Sissoo.                  | 15. Shullock.                                 |
| 7. Hindoo palm-toan (?)               | 16. Saul.                                     |
| 8. Korai ( <i>Acacia marginata</i> ?) | 17. Terminalia bhota (?)                      |
| 9. Laurus Sassafras, Goond-sora.      | 18. Top sopa.                                 |

#### No. 19.—WOODS OF TAVOY (Dr WALLICH).

|                              | Burmese               |   |
|------------------------------|-----------------------|---|
| 1. Acacia                    | Popesah               | A very large tree, used for posts and gollers.                          |
| 2                            | Pangadoo.             |   |
| 3 Anacardium                 | Thubbamboo            | A large tree, used in boat-building.                                    |
| 4 Artocarpus                 | Thoucuben             |   |
| 5                            |                       | A large tree.   |
| 6                            | Pynyatho or tannaburg | Wood not used.  |
| 7 Bignonia                   | Thathce               | A very large tree   |
| 8                            | Thugguinee            | A large tree, used in building.   |
| 9                            | Lambha                | A middle-sized tree   |
| 10 Calophyllum               | Turra-phoe            | Fed for masts, &c.  |
| 11 Carapa                    | Tala-on               | Used in building  |
| 12 Careya                    | Kaga                  | Large timber tree   |
| 13 Castanea martaabica       | Norpe or Zitha        |   |
| 14 Cebura Manghas            | Kulloo                | Wood not used.  |
| 15 Dillenia                  | Zimboon               | Used in building.   |
| 16 Dipterocarpus grandiflora | An or anutha          | An immense tree.  |
| 17                           | Kunnean phin          | Used as timber  |
| 18 Euphorbiacea              | Yamala                | Used for frames of lacquered ware.                                      |
| 19                           | Thaun                 | Used for fuel only.   |
| 20 Excoecaria (?)            | Thurrotha             |   |
| 21 Ficus                     | Thubboo               | Used in house-carpentry.  |
| 22                           | Thuppan               | Large tree, wood not used   |
| 23 Garcinia                  | Pullowa               | Large tree, used for posts, &c.   |
| 24 Grewia                    | Minya                 |   |
| 25 Heritiera Fomes           | Kunmazoo              | Very large tree very hard and durable wood.                             |
| 26 Hibiscus macrophyllus     |                       | Used in building.   |
| 27                           |                       |   |
| 28 Hopea floribunda          | Tanthey               | A very large tree.  |
| 29 Lagerstrœmia              | Kuenmounce or puma    | Used in building.   |
| 30 Laurus                    | Kulowa or kurrowa     |   |
| 31                           | Panatha               | Used in house-carpentry   |
| 32                           | May then              | A large tree, good useful wood, much used.                              |
| 33                           | Keemna                | Small tree, used for posts  |
| 34                           | Thuggoo               | Used for oars, &c.  |
| 35                           | Thitya                | Very large tree, used in building, &c.                                  |
| 36                           | Kay Au                | Used in house-carpentry.  |
| 37 Mimosa                    | Thubbae               | Used in ship-building   |
| 38                           |                       |   |
| 39 Elengi                    | Maikay                | A tough close-grained wood, used for handles.                           |
| 40 Murraya                   | Thomnanga             | A large tree, used in boat-building.                                    |
| 41                           | Kouthot or Kunnean    | A large tree, used in flooring houses.                                  |
| 42 Oxyria peltata            | Phaoun                |   |
| 43 Pierardia (?)             | Kunna or Kuzzo.       |   |
| 44 Pinus Dammar              |                       | A very large tree, used in building.                                    |
| 45 Pterocarpus (?)           | Puddow                | A large tree, used for furniture, &c.                                   |
| 46 Rottlera                  | Mimaeko.              |   |
| 47                           | Keoun-lae             | A large tree, used for rudders, &c.                                     |
| 48 Sandoricum                | Thittoo               | Used for furniture.   |
| 49 Sapota (?)                | Palaepran             | A very large tree, used in building.                                    |
| 50 Sonneratia (?)            | Thaumma               | A small tree.   |
| 51 Sterculia (?)             | Kununu                | An enormous tree.   |
| 52                           | Thakadoo.             |   |
| 53 Symplocos (?)             | Kain-tha-phogee       | Used in boat-building.  |
| 54 Syzygmis Tavoyana         | hu-tha                | A very large tree, used for building, boxes, &c.                        |
| 55                           | Kunnu Keunkse         | Used for beams, posts, &c.  |
|                              | Kunnu Kounla          |   |
| 56 Terminalia                | Thuphanga.            |   |
| 57 Ternstroemia              | Fuzeen swa            | A large tree, used in building  |
| 58 Uvaria                    | Thulbot               | A large tree, used for boat-building.                                   |
| 59 Wrightia antidysenterica  | Lathou                | Small tree, not used.   |
| 60 Xylocarpus                | Keannan               | Very durable timber.  |
| 61 Zizyphus                  | Zerthee               | Hard and durable wood.  |
| 62                           | Ahnaun                | Strong and very durable timber, used in ship-building.                  |
| 63                           | Bah-nah-thoa          | Useful timber   |
| 64                           | Com-moo               | Good timber, used for building houses and boats.                        |
| 65                           | Maantha               | Small but valuable wood.  |
| 66                           | Kaungo-kurro          | A heavy but durable wood, used in boat-building: specific gravity 0.960 |
| 67                           | Kamnan                | Strong crooked wood, used for gun-stocks.                               |
| 68                           | Kuddoot-aldi          | A large tree, used in house and ship-building.                          |

## No. 19.—WOODS OF TAVOY (Dr. WALLICH)—continued.

|           | Burmese.          |   |
|-----------|-------------------|---|
| 69. ——— ? | Kuddoot-nu        | Inferior wood, used in boat-building.             |
| 70. ——— ? | Kumml.            |   |
| 71. ——— ? | Mahnaban          | Used for bows, lances, beams, rafters, &c.        |
| 72. ——— ? | May-kin           | Used for rudders and anchors.                     |
| 73. ——— ? | May-maka          | Used in ship-building.                            |
| 74. ——— ? | May-rang          | Said to be very durable.                          |
| 75. ——— ? | May-toek          | Used for the bottoms of ships; preferred to teak. |
| 76. ——— ? | Megenge           | A large tree, used in building.                   |
| 77. ——— ? | Penlay-peen       | Used in building.                                 |
| 78. ——— ? | Pienmahne         | Yields very strong knee-timber.                   |
| 79. ——— ? | Pienmah-pue.      |   |
| 80. ——— ? | Pantheys.         |   |
| 81. ——— ? | Tauguet-nu.       |   |
| 82. ——— ? | Teutha.           |   |
| 83. ——— ? | Thanga-et-thittoo | Inferior wood.                                    |
| 84. ——— ? | Thau-bau-po       | Inferior wood, used for common canoes.            |
| 85. ——— ? | Thau-bau-thau-lay | Very flexible wood.                               |
| 86. ——— ? | Theyalf           | Inferior wood.                                    |
| 87. ——— ? | Thounmynga        | Used in building.                                 |
| 88. ——— ? | Thymbro           | Good strong durable wood, used in boat-building.  |

## No. 20.—WOODS OF TAVOY (Mr. Commissioner BLUNDELL).

|                            |            |  |
|----------------------------|------------|--|
| 1. Aman                    | —          | A small tree; used for building.   |
| 2. Bep-than                | —          | Used for building.   |
| 3. Bep-won                 | —          |  |
| 4. Bhanbhway               | —          | Used for house-posts; like sissoo.   |
| 5. Bha-ta-ka               | —          | Used for common carpentry.   |
| 6. Daup-yan                | —          | Used for building.   |
| 7. Eng-beng                | —          | Strong wood; used for common carpentry.  |
| 8. Kad-wot-nu              | Cedrela?   | Used for house and ship-building; large lumber, 40 to 70 feet; specific gravity 1.060. |
| 9. Kanna-tso               | —          | A very tough close-grained wood.   |
| 10. Kaenyeng-kyauk-khyay   | —          | Used for boat, ship, and house-building; yields an oil; not attacked by insects.       |
| 11. —                      | —          | rather staky.  |
| 12. Ka-nyeng-pyan          | —          | A heavy, grey wood; used for hand-pikes.   |
| 13. Katso                  | —          | Like Toon; used in building, &c.   |
| 14. Kaung-thmoo-ysep-say   | —          | A rough, strong wood; used for posts, &c.  |
| 15. Keng thep-guyung-ywapt | —          | A light, inferior wood; used in building.  |
| 16. Kengthep-pheoot-kyay   | —          | A sound small wood; used in building.  |
| 17. Khamoung-nec           | —          | Heavy wood, not attacked by insects.   |
| 18. Khamoung-pylon         | —          | Small-sized, compact, yellowish-grey wood.   |
| 19. Kharaway-nu            | —          | Porous, heavy, strong wood, not attacked by insects.                                   |
| 20. Kouk-ko                | —          | Employed for bottoms of boats.   |
| 21. Kyay-tsay-gyu-khyay    | —          | A heavy, compact, dark wood; suitable for gun-stocks.                                  |
| 22. Kyay-tsay-bayoun       | —          | useful for common carpentry.   |
| 23. Kyep-yo                | —          | A kind of teak.  |
| 24. Kywon-ho               | —          | A soft wood like the nauclea.  |
| 25. Kywon-ma               | —          | a variety.   |
| 26. Lienman                | —          | A small tree; heavy, close-grained, light-coloured wood, like terminalia.              |
| 27. Mala-ka                | —          | Small-sized, strong wood; useful for handles.  |
| 28. Ma-yam                 | —          | An indestructible, strong, heavy, dark-red wood.                                       |
| 29. Mee-kyauk-kyay         | —          | A heavy wood, not attacked by insects.   |
| 30. Meop-thua-ban          | —          | A small-sized, compact, grey wood; used for handles, &c.                               |
| 31. Miaup-bout             | —          | Used for furniture, &c.  |
| 32. Mya-kamaun             | —          | A valuable strong black wood; used for knife-handles.                                  |
| 33. Myeng-ta-bop           | —          | A strong, bluish-grey wood; adapted for handles.                                       |
| 34. Ngoo-beng              | —          | A strong wood; used for posts and planking.  |
| 35. Nalae-lyeng            | —          | A close-grained, strong, heavy wood; useful for handles.                               |
| 36. Pan-loun               | —          | A close-grained red wood; used for building.   |
| 37. Pantheet-ya            | —          | A good white rough wood; useful for boat-building.                                     |
| 38. Patseng-tsway          | —          | Small-sized strong wood.   |
| 39. Patseng-ngo            | —          | A superior high-coloured aromatic wood, like mahogany.                                 |
| 40. Peng-lay-byun          | —          | Small-sized tough wood.  |
| 41. Peng-lay-oun           | —          | Strong, rough, red wood, like Mimosa seripa.   |
| 42. Peng-lay-kaboy         | —          | A heavy small-sized wood; suitable for handspikes, handles, &c.                        |
| 43. Pee-daup               | Mimosa     |  |
| 44. Pinnay                 | Artocarpus |  |
| 45. Pyaung-pylon           | —          | Strong, close-grained, yellow wood.  |
| 46. Pyang-khodo            | —          | A compact, heavy, yellow wood.   |
| 47. Tag-nyang              | —          | Small-sized, heavy, close-grained, red wood.   |
| 48. Takiep-nec             | —          | A useful furniture wood.   |
| 49. Tha-bian               | —          | A very strong, close-grained, heavy, light-coloured wood.                              |
| 50. Thabyay-nec            | —          | Used for canoes.   |
| 51. The-tyoo               | —          | A strong, close-grained, brownish-grey wood; used for house-posts.                     |
| 52. Thet-ta-gree           | —          | A heavy close-grained wood.  |
| 53. Thet-ya-ban            | —          | Suitable for common carpentry.   |
| 54. Thet-ya-nec            | —          | A close-grained teak; used for posts.  |
| 55. Thet-ya-lou            | —          | A close-grained brown wood, rather staky.  |
|                            |            | A heavy strong wood.   |

## No. 20.—WOODS OF TAVOY (Mr. Commissioner BLUNDELL)—continued.

|                         |       |  |
|-------------------------|-------|--|
| 56. Thiem - - - -       | - - - | A serviceable timber.  |
| 57. Thingan-kyap - - -  | - - - | A close-grained, heavy, strong wood; used in ship and house-building, for carts, &c. |
| 58. Thmeng-ha - - -     | - - - | Like red jarrool; used for posts and cotton-rollers.                                 |
| 59. Thmeng-tahout - - - | - - - | A small, heavy, coarse, brown wood; used for door-frames and boat-beams.             |
| 60. Toung-bhapt - - -   | - - - | Rough, knotty wood; used for knife and spear-handles.                                |
| 61. Toung-bhien - - -   | - - - | A light, porous wood; used for common carpentry.                                     |
| 62. Toung-byeng - - -   | - - - | A kind of red saul.  |
| 63. Toung-byion - - -   | - - - | A close-grained, brown, shaky wood.  |
| 64. Toung-kha-ray - - - | - - - | Red jarrool; used in boat-building.  |
| 65. Tseng byloun - - -  | - - - | A compact greyish-brown wood; suitable for common carpentry.                         |

| 69. Theng-gan       | - | - | - | -           | An excellent compact wood; used for carts, boats, house-building, &c., and considered superior to teak; specific gravity 0.911. |
| 70. Thep-yeng       | - | - | - | -           | A fine-grained wood.  |
| 71. Theet-phylone   | - | - | - | Mimosa (?)  | A fine white wood; used for fan-handles.  |
| 72. Theet-to        | - | - | - | -           | A dark-coloured, hard, heavy wood; used in boat-building, &c.   |
| 73. Theet-ya        | - | - | - | -           | A fine strong, tough, brown wood; used for rice-mortars, or pounders.   |
| 74. Thiem           | - | - | - | -           | Used in house-building and carpentry.   |
| 75. Toung-bien      | - | - | - | -           | A strong heavy wood; used for carts and boat-building.  |
| 76. Toung-thau-gyee | - | - | - | -           | A hard, compact, dark-brown wood.   |
| 77. Toung-tha-byion | - | - | - | Mimosa      | A strong, red, heavy wood; used in building.  |
| 78. Tseet           | - | - | - | -           | Used for house-posts, and in boat-building.   |
| 79. Tsekka-doun     | - | - | - | -           | Used for house-posts, and in boat-building, but very shaky.   |
| 80. Tshau-yo        | - | - | - | -           | A heavy, very strong, white wood, but liable to attacks of insects.   |
| 81. Tshan-tshay     | - | - | - | -           | A useful wood, but shaky, and liable to attacks of insects.   |
| 82. Tah-wai-lwai    | - | - | - | -           | A hard red wood, suitable for cabinet-work; used for musket-stocks.   |
| 83. Tahiet-khyeen   | - | - | - | -           | Used for house-posts.   |
| 84. Tsay-dan        | - | - | - | -           | Hard, heavy, tough wood; used for wheels, musket-stocks, &c.  |
| 85. Tawot-ba-lwot   | - | - | - | -           | Like the wood of Lagerstræmia.  |
| 86. Yam-nandy       | - | - | - | -           | A good and valuable wood; used for carving images.  |
| 87. Yeng-taip       | - | - | - | -           | A strong useful wood; used for common carpentry.  |
| 88. Yetha-byay      | - | - | - | -           |   |
| 89. Yoga-thieet     | - | - | - | -           | Used for carved images; the bark used as soap.  |
| 90. Zee-byion       | - | - | - | -           | A close compact wood, but rather shaky; not attacked by insects.  |
| 91. Zeng-bywom      | - | - | - | -           | A useful wood; employed in building.  |

## No. 22.—WOODS OF TENASSERIM.

1. Bauhinia, or mountain ebony.
2. Calophyllum, sp.
3. Careya arborea, C. sphaerica, hambooco.
4. Cyrtophyllum fragrans. Anan.
5. Dalbergia latifolia, or lana wood.
6. Diospyros, sp.
7. Erythrina.
8. Fagraea fragrans.
9. Grewia, sp.
10. Hopea odorata, or thengan.
11. Hederia minor, or soondra.
12. Inditte, or ebony.
13. Inga xylocarpa, pyangadian.
14. Kazarot.
15. Laurus, sp., sassafras wood.
16. Lagerstræmia Regina; jarrool, or jamoung.
17. Lagerstræmia macrocarpa; pyen ma, or jarrool.
18. Mergul, red wood.
19. Pinda Latteri.
20. Pterocarpus Wallichii, Pterocarpus Indica, podauck.
21. Rose-wood.
22. Sterculia foetida.
23. Sandal-wood (wild).
24. Thanaka.

25. Tectona grandis.
26. Vitex arborea.

The "Soondra" is a very tough and elastic wood, commonly used for boat-building, &c.; it is, however, a very perishable wood, and shrinks a good deal in seasoning; specific gravity 1.002 to 1.086. From Major H. Campbell's valuable experiments on the strength of Indian timber, this is evidently a very strong wood; since out of 27 woods which he examined, he found the Soondra to be the strongest.

"Anan," a tree belonging to the nux vomica tribe, one of the hardest and most compact woods known.

"Podauck," a leguminous tree, commonly called "rose-wood," a very beautiful, compact, and hard timber, resembles the Andaman wood.

"Thengan," *Hopea odorata*, an enormous tree of the *Dipterocarpeæ*, or Saul tribe; a very strong but coarse-grained wood, used for making canoes;—immense quantities of good dammer, or resin, are obtained from this tree.

"Pyangadean," a tree belonging to the Acacia tribe, commonly called "iron-wood," in the Arracan provinces; a very hard, dense, and durable wood.

## No. 23.—WOODS OF MARTABAN (Dr. WALLICH).

|                           |   |            |   |  |
|---------------------------|---|------------|---|--|
| 1. Calophyllum            | - | Thurapi    | - | A large tree; used for masts and spars.                      |
| 2. Careya                 | - | Kaza       | - | used for posts, &c.  |
| 3. Cynometra              | - | Maingga    | - | A small tree.  |
| 4. Diospyros (?)          | - | Ryamucha   | - | Used in house-building.                                      |
| 5. Elaeocarpus            | - |            | - | Very large timber; used for masts and house-posts.           |
| 6. Fagraea fragrans       | - | Ahnah-beng | - | Compact, hard, yellow, and very beautiful wood; little used. |
| 7. Gordonia (?)           | - | Kaza       | - | Large common timber.   |
| 8. Hopea odorata          | - | Tengau     | - | An immense tree.   |
| 9. Mesnaban               | - |            | - | A durable pillar wood.                                       |
| 10. Rongamia atropurpurea | - | Lagu       | - | A noble tree; used in boat and house-building.               |
| 11. Quercus Amherstiana   | - | Tirobac    | - | A large tree; used in boat-building.                         |
| 12. Tectona grandis       | - |            | - | Teak wood.   |
| 13. Terminalia blatta     | - |            | - |  |
| 14. Xanthophyllum         | - | Saphew     | - | A very large tree; used for posts and rafters.               |

## No. 25.—WOODS OF CHETTAGONG (Capt. MARQUART).

1. Conocarpus—Buthna.
2. Diospyros melanoxylon.
3. Dypterocarpus—sargetia.
4. Acacia, sp.—koom koyre.
5. Swietenia chickcrassia—Chuckrassee.

## No. 26.—WOODS OF MIRZAPORE (BENARES).

1. Dipterocarpus—Bigeedar.
2. Diospyros—Abnoos.
3. Conocarpus—Sickroa.
4. Pentaptera glabra—Asan.
5. Phyllanthus emblica—Amorah.

6. Terminalia Belleirica—Rutera.
7. " " safed mooslee.
9. " " hurrah.

Some fine planks of teak, from Rangoon, nearly  $3\frac{1}{2}$  feet wide, are exhibited by Mr. McDOWELL (p. 888); these were deemed deserving of Honourable Mention. Teak is a light-brown, porous, and quick-growing wood; it derives much of its value from the aromatic, oily substance with which it is more or less saturated in the fresh state. A very interesting series of examples of teak wood, formed by Mr. SEPPING, of Calcutta, is contributed from the Naval Department of the Honourable East India Company. It consists of 72 specimens from various localities, and the weight of each, per cubic foot, has been carefully ascertained. From the experiments of Major H. Campbell, it appears that the density of teak wood varies from 0.594 to 0.876, according to its quality and the mode in which it is seasoned; whilst Captain Baker found it to vary from 0.631 to 0.792. It is evident, however, from the following table, which shows the results of Mr. Sepping's experiments, that the specific gravity of teak varies considerably more, not only between the wood of different forests, but even in different parts of the same beam.

## No. 27.—SPECIMENS OF TEAK FROM THE WOODS OF MOULMEIN.

| No. | Place in which the Tree was Cut | Number of Years Cut. | Girth of the Tree when roughly Trimmed. | Specific Gravity of two Samples. |
